Summary

The impact of foreign direct investment on U.S. employment is provoking a national debate. While local communities compete with one another for investment projects, many of the residents of those communities fear losing their jobs as U.S. companies seek out foreign locations and foreign workers to perform work that traditionally has been done in the United States, generally referred to as outsourcing. Some observers suggest that current U.S. experiences with outsourcing are different from those that have preceded them and that this merits legislative actions by Congress to blunt the economic impact of these activities. Other observers argue that investing abroad by U.S. multinational companies impedes the growth of new jobs in the economy and thwarts the nation's investments in high technology sectors. Some opponents also argue that mid-career workers who lose good-paying manufacturing and service-sector jobs likely will never recover their standard of living.

Economists and others generally argue that free and unimpeded international flows of capital have a positive impact on both domestic and foreign economies. Direct investment is unique among international capital flows because it adds permanently to the capital stock and skill set of a nation, but it also challenges the general theory of capital flows because of the presence of strong cross-border and intra-industry investment. Supporters contend that to the extent that foreign investment shifts jobs abroad, it is a minor component of the overall economic picture and that it is offset somewhat by the investment of foreign firms in the U.S. economy (referred to as insourcing), which supports existing jobs and creates new jobs in the economy.

Broad, comprehensive data on U.S. multinational companies generally lag behind current events by two years and were not developed to address the issue of jobs outsourcing. Many economists argue, however, that there is little evidence to date to support the notion that the overseas investment activities of U.S. multinational companies play a significant role in the rate at which jobs are created in the U.S. economy. Instead, they argue that the source of job creation in the economy is rooted in the combination of macroeconomic policies the nation has chosen, the rate of productivity growth, and the availability of resources. This report addresses these issues by analyzing the extent of direct investment into and out of the economy, the role such investment plays in U.S. trade, jobs, and production, and the relationship between direct investment and the broader economic changes that are occurring in the U.S. economy.

Overview

The United States is the largest foreign direct investor in the world and the largest recipient of such investment funds.¹ This active role in foreign investment has sparked a national debate over various aspects of foreign investment, including the impact on employment; the implications for national security of foreign direct investment in U.S. industrial firms; the effect on corporate research and development; and the implications for high-technology jobs, especially on science and engineering activities that are deemed to be important for continuing economic advancement. In 2004, Congress awarded a grant through P.L. 108-447 to the National Academy of Public Administration (NAPA) to conduct a comprehensive study on outsourcing, or off-shoring, and its major economic effects, particularly on any “associated shifts in employment.”² The NAPA study distinguished between outsourcing, or the contracting of services or activities to unaffiliated firms located either domestically or internationally, from off-shoring, or the shifting of services or activities abroad to unaffiliated firms or to affiliated firms. The data used in this report, however, do not distinguish between outsourcing and off-shoring or among a broad range of other activities that may be associated with foreign investment.

On a historical cost basis, or book value basis, the Department of Commerce estimates that by the end of 2009, U.S. firms had accumulated \$3.5 trillion worth of direct investment abroad, compared with the \$2.3 trillion foreign investors had spent to acquire or establish businesses in the United States, when direct investment is measured at historical cost.³ As **Figure 1** shows, direct foreign investment flows generally have increased since 2003, while U.S. direct investment abroad dropped sharply in 2005 as a result of one-time tax provisions, but then rebounded sharply in 2006.⁴

¹ This is true on a historical cost, or *cumulative* position basis, but the sharp drop in foreign direct inflows after 2000 has meant that other countries have occasionally displaced the United States as the largest recipient of annual foreign direct inflows.

² This study was completed in three parts, with associated publications. See *Off-shoring: An Elusive Phenomenon*, National Academy of Public Administration, January 2006; *Off-Shoring: How Big is it?*, October 2006; and *Off-Shoring: What Are Its Effects?*, National Academy of Public Administration, January 2007.

³ Ibarra-Caton, Marilyn, *Direct Investment Positions for 2009*, *Survey of Current Business*, July 2010, p 20. The position, or stock, is the net book value of U.S. parent company’s equity in, and outstanding loans to, their affiliates abroad. A change in the position in a given year consists of three components: equity and intercompany inflows, reinvested earnings of incorporated affiliates, and valuation adjustments to account for changes in the value of financial assets. The Commerce Department also publishes data on the U.S. direct investment position valued on a current-cost and market value bases. These estimates indicate that U.S. direct investment abroad increased by \$308 billion, but increased when measured by market value by \$1.2 trillion in 2009 to reach \$3.7 and \$3.1 trillion, respectively. Nguyen, Elena L., *The International Investment Position of the United States at Yearend 2009*, *Survey of Current Business*, July 2010, p.10.

⁴ The United States defines foreign direct investment as the ownership or control, directly or indirectly, by one foreign person (individual, branch, partnership, association, government, etc.) of 10% or more of the voting securities of an incorporated U.S. business enterprise or an equivalent interest in an unincorporated U.S. business enterprise. 15 CFR § 806.15 (a)(1). Similarly, the United States defines direct investment abroad as the ownership or control, directly or indirectly, by one person (individual, branch, partnership, association, government, etc.) of 10% or more of the voting securities of an incorporated business enterprise or an equivalent interest in an unincorporated business enterprise. 15 CFR § 806.15 (a)(1).

Figure I. Foreign Direct Investment in the United States and U.S. Investment Abroad, Annual Flows 1990-2009

Source: U.S. Department of Commerce.

Note: The drop in U.S. direct investment abroad in 2005 reflects actions by U.S. parent companies to take advantage of a one-time tax provision.

Recent Department of Commerce data indicate that foreigners invested \$152 billion in U.S. businesses and real estate in 2009, down sharply from the \$319 billion invested in 2008.⁵ Similarly, new spending by U.S. firms on businesses and real estate abroad, or U.S. direct investment abroad,⁶ fell from the \$332 billion invested in 2008 to \$221 billion in 2009.

Globally, the total, or cumulative, amount of foreign direct investment reached nearly \$18 trillion in 2009 (the latest year for which detailed data are available), as indicated in **Figure 2**. Nearly three-fourths of this amount is invested in the most economically advanced developed economies. The developed economies not only are the greatest recipient of investment funds, but they are also the greatest source of those funds. Similar to the United States, those countries that are the largest overseas investors also tend to be the most attractive destinations for foreign investments.

⁵ Weinberg, Douglas B., Erin M. Whitaker, U.S. International Transactions: Fourth Quarter and Year 2009. *Survey of Current Business*, April 2010, p. 28. Direct investment data reported in the balance of payments differ from capital flow data reported elsewhere, because the balance of payments data have not been adjusted for current cost adjustments to earnings.

⁶ The United States defines direct investment abroad as the ownership or control, directly or indirectly, by one person (individual, branch, partnership, association, government, etc.) of 10% or more of the voting securities of an incorporated business enterprise or an equivalent interest in an unincorporated business enterprise. 15 CFR § 806.15 (a)(1).

The clear exception to this general observation is Japan, which had invested over \$700 billion abroad through 2009, but had received over \$200 billion in investment inflows. Among the developing economies, Asia, which includes China, has accumulated \$2.9 trillion in direct investment, followed by Latin America (\$1.5 trillion) and Africa (\$500 billion).

Figure 2. Inward and Outward Global Direct Investment Position, By Major Area, 2009

Source: United Nations.

Global direct investment flows picked up sharply after 2004, following three years of reduced flows. According to the United Nations' *World Investment Report*,⁷ the largest 100 multinational corporations in the world experienced a stagnation of their sales, employment, and growth in assets from 2000 to 2003, but global foreign direct investment flows picked up in the 2006-2007 period before falling in 2008, as indicated in **Table 1**. In 2006, and 2007 global direct investment flows grew by 38%, and 18%, respectively, to reach nearly \$2 trillion. The rise in global direct investment flows was driven by an increase in corporate profits worldwide and resulting higher stock prices that raised the value of cross-border mergers and acquisitions. In 2008, global direct investment flows fell by 14% to total \$1.7 trillion, due in part to the tightening up of credit markets and slowing economic growth. Furthermore, the global financial crisis sharply reduced global investment flows in 2009 to \$1.1 trillion. The developed economies generally absorb about two-thirds of global direct investment flows, with the developing economies sharing the rest. Africa continues to receive the smallest share, generally less than 3%, with Latin America receiving about 8% and Asia getting between 18% and 22%. These shares changed abruptly in

⁷ *World Investment Report 2010*, United Nations, July 2010. P. 5.

2009 as the financial crisis tightened credit and reduced merger and acquisition activity, a major factor in direct investment in the developed economies.

U.S. and Foreign Multinational Companies

By the end of 2008, there were more than 2,200 U.S. parent companies with more than 26,000 affiliates operating abroad, as **Table 2** indicates. In comparison, foreign firms had more than 5,500 affiliates operating in the United States. U.S. parent companies employed over 21 million workers in the United States, compared with the 11.9 million workers employed abroad by U.S. firms and more than 6 million persons employed in the United States by foreign firms. Although the U.S.-based affiliates of foreign firms employ fewer workers than do the foreign affiliates of U.S. firms, they paid almost as much in aggregate employee compensation in the United States as did the U.S. affiliates operating abroad. The data also suggest that U.S. parent companies are more efficient than either the U.S. affiliates of U.S. firms or foreign firms operating in the United States with higher output per employee. Foreign firms operating in the United States are more capital intensive relative to employment than U.S. parent firms or U.S. affiliates, likely reflecting the newer age of the capital stock of the foreign firms. The U.S. affiliates of foreign companies, however, had one-quarter higher value of gross product than did the foreign affiliates of U.S. firms operating abroad. The foreign affiliates of U.S. firms, however, had total sales that were nearly twice as high as that of the U.S. affiliates of foreign firms, likely reflecting the slowdown in economic growth that had begun in the United States. The foreign affiliates of U.S. firms, however, paid more than three times more in taxes to foreign governments than did the affiliates

of foreign firms operating in the United States. The overseas affiliates of U.S. parent companies also paid nearly twice as much in taxes relative to their sales as did U.S. parent companies and as did foreign-owned affiliates operating in the United States.

Table 2. Select Data on U.S. Multinational Companies and on Foreign Firms Operating in the United States, 2008

(dollar amounts in millions of dollars)

	U.S. Multinational Companies		U.S. Affiliates of Foreign Firms
	Parent Companies	Foreign Affiliates	
Number of firms	2,220	26,548	5,546
Employment (thousands)	21,103	11,879	6,279
Employee compensation	\$1,373,115	\$490,124	\$451,984
Gross product	\$2,396,288	\$1,211,854	\$1,726,681
Total assets	\$16,841,239	\$12,504,725	\$12,666,896
Sales	\$8,727,800	\$6,107,864	\$3,819,986
Taxes	\$165,028	\$195,100	\$33,398

Sources: U.S. Direct Investment Abroad: Operations of U.S. Parent Companies and Their Foreign Affiliates, Preliminary 2007 Estimates; and Foreign Direct Investment in the United States: Operations of U.S. Affiliates of Foreign Companies, Preliminary 2007 Estimates.

U.S. multinational companies also play an important role in the U.S. economy, as indicated in **Table 3**. According to the total output of U.S. parent companies, or gross product, they produced \$2.4 trillion in goods and services in 2008, down slightly from the \$2.59 trillion dollars they produced in 2007. This amount comprised about 19% of total U.S. private industry gross product, a share of total gross product of U.S. parent companies that was the lowest since the early 1990s. The data also demonstrate the impact the improvement in the U.S. economy after 2002 had on the operations of U.S. multinational companies, as those companies grew slightly faster than the economy as a whole and increased their share of private gross product.

The manufacturing sector presents a similar picture. During the 1990s, manufacturing production continued to decline as a share of U.S. parent company gross product, falling from 53% of total output in 1994, to 44% in 2003, reflecting the slowdown in the rate of growth in the U.S. economy and the decline overall in the share of the U.S. economy devoted to the manufacturing sector. After the turnaround in U.S. economic growth in 2003, the share of output arising from the manufacturing sector rose to 45.7% in 2005 among U.S. parent companies, although the manufacturing sector continued to slide as a share of overall U.S. gross product and as a share of gross product of multinational firms. Since 2005, however, parent company share of U.S. manufacturing fell to around 40%, where it remained through 2008.

Within the U.S. economy, U.S. multinational corporations (MNCs) rank among the largest U.S. firms. According to data collected by the Commerce Department's Bureau of Economic Analysis (BEA), when American parent companies and their foreign affiliates are compared by the size structure of employment classes, 40% of the more than 2,000 U.S. parent companies employ more than 2,499 persons each. These large parent firms account for 95% of the total number of

people employed by U.S. MNCs. Employment abroad is even more concentrated among the largest foreign affiliates of U.S. parent firms: the largest 2% of the affiliates account for 90% of affiliate employment.⁸

Table 3. Gross Product and Manufacturing Gross Product by U.S. Multinational Companies, 1994-2008

(in billions of dollars and percent share)

	Gross Product			Manufacturing Gross Product	
	U.S. Parent Companies (billions of dollars)	U.S. Private Industries	Parent Company Share of U.S. Private Gross Product	Share of Parent Company Gross Product	Share of U.S. Private Gross Product
1994	\$1,313.8	\$6,013.5	21.8%	53.1%	18.3%
1995	1,365.5	6,306.9	21.7%	53.0%	18.4%

Employment

A major source of contention in the United States regarding foreign investment focuses on the impact such investment is having on U.S. employment.⁹ Some observers argue that recent actions by U.S. parent companies are different from previous experiences with foreign investment because the parent companies are shifting jobs, capital, and technology offshore to their foreign affiliates in ways that are distinctly different from previous periods, and thereby are reducing

⁸ Mataloni, Raymond J. Jr. U.S. Multinational Companies: Operations in 1998. *Survey of Current Business*, July 2000. pp. 26-45.

⁹ For a comprehensive look at how offshore outsourcing has affected U.S. workers, see CRS Report RL32292, *Offshoring (or Offshore Outsourcing) and Job Loss Among U.S. Workers*, by Linda Levine. Also, see Drezner, Daniel W., The Outsourcing Bogeyman, *Foreign Affairs*, May/June, 2004; and Engardio, Pete, Aaron Berstein, and Manjeet Kripalani, Is Your Job Next? *Business Week*, February 3, 2003. P. 50-60.

employment in the United States. The Department of Commerce's Bureau of Economic Analysis provides the most comprehensive set of data on U.S. direct investment abroad and on foreign direct investment in the United States. These data, however, were not designed to link employment gains or losses in the United States, either for individual jobs, individual companies or in the aggregate, with the gains and losses of jobs abroad. The data also do not capture the extent to which firms may outsource such services as legal, payroll, accounting, and advertising to other firms, both domestic and foreign. While estimates of this effect span a wide range, studies by the National Association of Public Administrators (NAPA) concluded that outsourcing services to domestic firms was substantially larger than other types of business restructuring.¹⁰ The data in **Table 4** indicate that the employment trends of U.S. parent companies also are sensitive to economic conditions in the U.S. economy, particularly during periods in which economic growth slows down, as it did in the early 1980s, 1990s, in the early 2000s, and again in 2008.

Foreign investment data seem to indicate that, despite, or perhaps because of, the growing international linkages between economies, an expansion or a contraction in the rate of growth in the U.S. economy affects employment among U.S. parent companies more than it affects employment among the overseas affiliates of these parent companies. Nevertheless, changes in jobs among U.S. parent companies that are related to the overall rate of growth of the economy also affect the rate of growth in other countries and, therefore, in employment among the foreign affiliates, though not necessarily by the same magnitude, as indicated in **Figure 3**. Between 2002 and 2008, job gains were greater among the foreign affiliates of U.S. firms than among the parent companies, which is especially apparent when expressed in index number terms. Employment patterns among the parent companies and the foreign affiliates likely will be less promising in the 2009-2011 period as a result of the global economic recession and recovery.

The historical data generally indicate that the number of employees in the parent companies and in the affiliates tend to rise and fall in a similar pattern. While international linkages between U.S. and foreign economies mean that economic conditions in the United States have an impact on economic conditions abroad, there appears to be no distinct pattern between the creation or loss of jobs within U.S. multinational companies and a commensurate loss or creation of jobs among the foreign affiliates of those companies. Indeed, within most of the major developed countries, those economic forces that spur direct investment inflows also boost direct investment outflows. As a result, foreign direct investment may create jobs in the foreign affiliate that substitute for jobs in the parent company, but foreign investment may also positively affect job creation in both the parent company and the foreign affiliates, which makes it difficult to identify any broad trend regarding the employment effects of direct investment.

¹⁰ *Off-Shoring: How Big Is It?*, National Academy of Public Administrators, October 2006, p. 4.

Source: U.S. Department of Commerce.

The apparent lack of a direct linkage between job gains and losses among parent companies and their foreign affiliates likely arises from the many factors that can affect job gains and losses both within individual companies and within the economy as a whole. Economists typically categorize unemployment as cyclical, structural, seasonal, and frictional. Only the first two types are relevant to the current discussion and are likely to account for the largest share of unwanted job changes during any given year. When cyclical and structural unemployment coincide it often is difficult to distinguish among them.

Long-term changes in the basic structure of the economy, especially in such dynamic economies as the U.S. economy, alter the composition of jobs in the economy. Such changes occurred during the Industrial Revolution, when large numbers of workers migrated from farms to the rapidly developing manufacturing industries in northern cities. These structural changes represent the contraction and expansion of individual industries within the economy that arise from changes in technology and productivity that also direct changes in the composition of the Nation's trade activities and foreign investment patterns. Other job changes are related to the impact of the business cycle on the economy. Such a cycle is characterized by a general slowdown or expansion in the rate of growth in the economy due to broad macroeconomic factors and generally affects large segments of the economy.

Employment Trends

Both U.S. parent companies and their foreign affiliates lost employment during the economic contraction of the early 2000s, as is indicated in **Table 3**. These multinational companies apparently were affected more by the cyclical changes than were purely domestic firms. As a result, the parent companies' share of total U.S. civilian employment declined until 2004, when it began to increase, indicating that U.S. parent companies had at least stemmed the decline in their share of U.S. civilian employment (the relative share of U.S. employment represented by the U.S. foreign affiliates is provided only for comparison purposes). This improvement in the share of employment in the U.S. economy represented by U.S. multinational companies was reversed in 2008, when the share fell to its lowest level in recent years. The affiliates of foreign firms operating in the United States bucked this trend and added to their absolute level of employment except in 2003, when they reduced the number of workers and fell as a share of overall U.S. civilian employment. During the entire period most of the workers added by the affiliates were added through acquisitions of existing U.S. firms, rather than by establishing new enterprises.¹¹ Merger and acquisition activity dropped sharply in 2008 as a result of the global financial crisis, which made it difficult for firms to secure lines of credit for acquisitions. While acquisitions do not necessarily add to the total number of firms in the economy, they do support existing jobs and may even add to the overall demand for workers.

In 1985, U.S. multinational companies employed 24.5 million workers. Of this number, 18.1 million workers were employed by the parent company and 6.4 million workers were employed abroad by the foreign affiliates of those parent companies. Throughout the 1980s, an economic recession and a broad restructuring of the economy caused U.S. parent companies to lose employment, while employment among the foreign affiliates of these parent companies generally held even. By 1989, U.S. parent companies reversed the downward slide in their employment and began expanding their employment roles, a year behind the turn-around in employment of their foreign affiliates.

During the 1990s, the parent companies' share of the U.S. civilian labor force rose from 14.79% in 1992 to 17.45% in 2000. In comparison, the employment of U.S. affiliates abroad rose from a representative share of U.S. civilian employment of 5.62% in 1992 to 7.16% in 2001. During the same time, foreign firms were investing heavily in the United States and their employment rose from 4.7 million workers in 1992 to 6.4 million in 2001, or from 4% of U.S. civilian employment in 1992 to 4.7% in 2000.

Employment among U.S. parent companies dipped again between 2001 and 2004 in response to an economic downturn that occurred during this period. Employment among U.S. parent companies and their foreign affiliates rose after 2004 as economic growth in the United States and abroad rebounded. During each U.S. economic downturn, the level of employment of U.S. parent companies declined more sharply than it did among their foreign affiliates and the decline in employment lasted longer than it did among the employment of the foreign affiliates. As a result, the share of employment represented by the foreign affiliates increased from 26% in the 1980s to 34% in 2005 as a share of total U.S. multinational company employment, as indicated in **Figure 4**. As previously indicated, the economic recession of 2008 caused parent companies to reduce

¹¹ Anderson, Thomas, "Foreign Direct Investment in the United States: New Investment in 2008." *Survey of Current Business*, June 2009, p. 54-61.

their overall employment by over 2 million workers and reduced their share of total civilian employment to 14.5%.

Figure 4. Employment of the Foreign Affiliates of U.S. Parent Companies as a Share of the Total Employment of U.S. Multinational Companies, 1985-2008

(in percent shares)

Source: U.S. Department of Commerce.

The 1990s marked a major turn-around in employment for U.S. multinational companies. In 1994, U.S. parent companies began to regain employment at a faster rate than did the U.S. economy as a whole, thereby raising their share of total U.S. civilian employment. By 2000, U.S. parent company employment had reached 23.9 million, an all-time high and was equivalent to 17.5% of U.S. civilian employment, the highest share of such employment since 1983. Employment among the affiliates of foreign firms operating in the United States also peaked in 2000, mirroring the trend of U.S. parent companies. Employment among the overseas affiliates of U.S. parent companies continued to add workers through 2001, before they also were forced to reduce their total number of workers in 2002 due to slowing economic growth abroad. From 2004 through 2007, employment picked up in all three categories of firms as U.S. parent companies increased their employment and the foreign affiliates of U.S. parent firms expanded their employment to the highest levels recorded. In 2008, employment among U.S. parent companies declined, while employment among the foreign affiliates of U.S. firms and among the affiliates of foreign firms operating in the United States continued to add workers.

Employment by Sector and Area

Despite various concerns about the nature of recent foreign investment, Department of Commerce data indicate that recent foreign investment activity offers no evidence of a major deviation from well established long-term trends. These trends indicate that over half of all the employment of the foreign affiliates in 2008 was in the manufacturing sector, as indicated in **Table 5**. (Data in this table are for the non-bank U.S. affiliates rather than for the more inclusive category used elsewhere in order to provide detailed industry-level data.) Within the manufacturing sector, employment by the foreign affiliates of U.S. firms was concentrated most heavily in the transportation equipment sector, including automobile production, chemicals, and computers and equipment. Employment in the services sectors, wholesale trade, and retail trade grew most rapidly from 2006 to 2008 among the U.S. foreign affiliates. Sharp declines in employment were experienced in the utilities sector, beverages, textiles, and communications equipment. Most other sectors showed moderate increases in employment over the three-year period.

By country, over two-thirds of the investments and the employees of U.S. overseas investors are in the most highly developed economies where labor compensation, standards of living, and consumer tastes are most closely comparable to those in the United States. These countries are also the largest foreign direct investors and the largest foreign employers in the United States, as indicated in **Figure 5** and **Figure 6**. U.S. direct investment abroad and employment have been heavily concentrated in Europe since the end of World War II. This investment coincided with the rapid expansion in economic activity that followed WWII and the formation of the European Economic Community (EEC), now the European Union. Initially, U.S. firms wanted to establish a foothold in Europe inside the tariff protection created by the formation of the EEC and access to the European market continues to draw U.S. direct investment. Moreover, with the enlargement

of the European Union,¹² the largest share of U.S. direct investment abroad likely will remain focused on this region for some time to come. Nevertheless, from 2006 to 2008, employment by U.S. firms in Asia, particularly in China, Malaysia, and Singapore grew especially rapidly. In China, for instance, employment over the 2006-2008 period grew by 31% to reach 774,000. As a whole, employment by U.S. firms in Asia accounts for one-fourth of the total employment by U.S. firms abroad.

Figure 6. Employment of U.S. Foreign Affiliates Abroad and Affiliates of Foreign Firms in the U.S., by Country or Region, 2008

Source: U.S. Department of Commerce.

Some U.S. observers are concerned that the U.S. economy is losing jobs to developing countries where wage rates and environmental standards are considerably below those in the United States. The data, however, show no appreciable change in the underlying trend that favors investment and jobs in developed economies. In addition, U.S. foreign affiliates as a whole lost employment in the early 2000s, similar to U.S. parent companies. Employment losses were mostly concentrated among the highly developed economies of Europe, because their close ties with the U.S. economy made them highly susceptible to the slowdown in the U.S. economy. Among the developing countries, U.S. investors have long been attracted to Latin America, likely because of its close proximity to the United States. In 2008, U.S. affiliates in Mexico had 900 thousand employees, third behind affiliates in the United Kingdom with nearly 1.17 million employees and affiliates in Canada with 1.06 million employees. At times, employment associated with U.S. direct investment in Latin America and Asia has increased, while employment in Africa and the Middle East has dropped, leading some observers to conclude that investment and employment among the developed and developing countries represent two relatively independent groups and that little employment is exchanged between them. This proposition would mean that employment shifts occur primarily between developing countries, such as in Latin American and Asia, and among developed countries, primarily within Europe and between Europe and Japan and Canada.

On average, the U.S. economy created about 2 million civilian jobs per year from 1982 to 1992 and about 1.7 million jobs per year from 1992 to 2002. From 2003 to 2007, the economy created an average of more than 2 million jobs per year. In 2008, the economy lost more than 2 million

as a result of the economic recession. The foreign affiliates of U.S. parent companies created an average of about 24,000 jobs per year from 1982 to 1992 and about 300,000 jobs per year from 1992 to 2002. From 2005 to 2007, these affiliates created more than 300,000 jobs per year, reflecting the increase in economic activity abroad. This amount dropped to about 100 thousand jobs in 2008, again reflecting the economic recession and financial crisis. There is no indication from the data, however, how many, if any at all, of the jobs created abroad by U.S. affiliates may have come at the expense of jobs created in the United States by U.S. parent companies.¹³ Over both periods, about two-thirds of the jobs that were added were in developed countries. As a result, U.S. foreign affiliates created on average about 100,000 jobs per year in low-cost developing countries during the 1992 to 2007 period, or about 6% of the average number of jobs created by the U.S. economy in a year.

Gross Product

Another concern expressed about U.S. direct investment abroad is that as U.S. parent companies shift jobs abroad, they also transfer economic production abroad, thereby permanently replacing U.S. domestic production with foreign production. This effect would be partially muted by foreigners investing in the United States. A large share of such investment is comprised of foreign acquisitions of existing U.S. firms. Although such acquisitions can not be characterized as creating new jobs, they do help sustain U.S. employment and production. There is bound to be some shifting of jobs and economic activities within the U.S. economy and between economies as part of the overall structural changes that occur within such dynamic economies as the U.S. economy. Such shifts in employment would continue to occur even in the absence of foreign investment. In addition, such shifting occurs as a result of greater economic specialization both within countries and between countries. As **Table 6** indicates, U.S. parent companies had a gross product, or total U.S. output, of \$3.6 trillion in 2008, representing 66% of the total output of U.S. multinational companies, compared with a gross product of their majority-owned foreign affiliates of \$1.2 trillion. As the U.S. economy expanded rapidly in the last half of the 1990s through 2001, U.S. parent companies performed better than their overseas affiliates and increased their share of total multinational company gross product from 74.6% in 1995 to 76% in 2001. Since then, however, output among U.S. parent companies grew at a slower pace than did that of their majority-owned foreign affiliates, which had grown to account for nearly 30% of total output of the U.S. multinational companies in 2007. In 2008, the rate of economic activity in the U.S. economy slowed down relative to that in other advanced economies, so that output by U.S. parent companies started declining sooner than that of output in affiliates located abroad.

U.S. Multinational Companies

While U.S. MNCs used their economic strengths to expand abroad during the 1980s and 1990s, the U.S.-based parent firms lost market shares at home, in large part due to corporate downsizing efforts to improve profits.¹⁴ U.S. MNC parent companies' share of all U.S. business gross domestic product (GDP)—the broadest measure of economic activity—declined from 32% to 25% from 1977 to 1989.¹⁵ This share stayed fairly constant at about 22% through much of the 1990s until 1998, when the parent companies experienced a short boost in their share of U.S. GDP as they benefitted from the rapidly growing U.S. economy. The economic slowdown in 2002 affected the parent companies disproportionately, as they lost shares of GDP. During the period from 1989 to 1998, these MNC parent companies increased their share of all U.S. business GDP in the services sector, which rose from 6% to 8% of U.S. GDP. The MNC share of all other industries rose from 16% to 18% during the 10-year period, but they lost shares in the manufacturing sector (from 62% to 58%) at a time when the U.S. manufacturing sector as a whole was shrinking as a share of national GDP (from 20% to 16%).¹⁶

¹⁴ Mataloni, Raymond J. Jr., and Lee Goldberg. "Gross Product of U.S. Multinational Companies, 1977-91." *Survey of Current Business*, February 1994. P. 42-63.

¹⁵ Mataloni, Operations of U.S. Multinational Companies. p. 31.

¹⁶ *Ibid.*, p. 31.

U.S. parent companies continue to place the largest share of their annual investments in developed countries, primarily in Western Europe, as indicated in **Table 7**. This tendency increased from 1999 to 2003 when U.S. direct investment shifted even more in favor of the richest developed economies: the share of U.S. direct investment going to developing countries fell from 28% in 1999 to 25% in 2003. In the 2005 through 2009 period, investment flows were somewhat erratic due to a one-time tax provisions in 2005 that sharply reduced U.S. direct investment that year and the following year as flows returned to their historical trend, and the economic recession in 2008 and 2009. During this five-year period, flows to Asia increased as a share of total U.S. direct investment abroad, primarily due to a large increase in direct investment in China. Shifts in U.S. direct investment abroad over the last decade reflect fundamental changes that occurred in the U.S. economy during the period. As investment within the U.S. economy shifted from extractive, processing, and manufacturing industries toward high technology services and financial industries, U.S. investment abroad mirrored those changes. Consequently, U.S. direct investment abroad focused less on the extractive, processing, and basic manufacturing industries in developing countries and more on high technology, finance, and services industries located mostly in highly developed countries with advanced infrastructure and communications systems.¹⁷ Investments in the finance and services sectors grew twice as fast, on the whole, as direct investment abroad overall during the 1996-2000 period. Within the manufacturing sector, food processing, chemicals, and metals lagged in growth behind the industrial machinery, electronic, and transportation sectors.

Source: U.S. Department of Commerce.

Note: (D) indicates that the data have been suppressed by the Department of Commerce to protect the confidentiality of the foreign investor. The drop in U.S. direct investment abroad in 2005 reflects actions by U.S. parent firms to reduce the amount of reinvested earnings going to their foreign affiliates for distribution to the U.S. parent firms in order to take advantage of one-time tax provisions in the American Jobs Creation Act of 2004 (P.L. 108-357).

Foreign-Owned Firms

The performance of foreign-owned establishments, on average, compared with their U.S.-owned counterparts presents a mixed picture. Historically, foreign-owned firms operating in the United States have had lower rates of return, as measured by return on assets, than U.S.-owned firms, although the gap between the two groups appears to have narrowed over time. According to the Bureau of Economic Analysis, this narrowing of the gap in the rate of return appears to be related to age effects, or the costs associated with acquiring or establishing a new business that can entail startup costs that disappear over time and market share.¹⁸ By other measures, foreign-owned manufacturing firms appear to be outperforming their U.S. counterparts.¹⁹ Although foreign-

¹⁸ Mataloni, Raymond J. Jr., An Examination of the Low Rates of Return of Foreign-Owned U.S. Companies, *Survey of Current Business*, March 2000, p. 55.

¹⁹ *Foreign Direct Investment in the United States, Establishment Data for 2002*, Bureau of Economic Analysis, June 2007.

owned firms account for less than 3% of all U.S. manufacturing establishments, they have had six times more value added on average and seven times higher value of shipments than other manufacturing establishments. The average plant size for foreign-owned firms is much larger—six times—than for other U.S. firms, on average, in similar industries. This difference in plant size apparently rises from an absence of small plants among those that are foreign-owned. As a result of the larger plant scale and newer plant age, foreign-owned firms paid wages on average that were 60% higher than other U.S. manufacturing firms, had 40% higher productivity per worker, and 58% greater output per worker than the average of comparable U.S.-owned manufacturing plants. Foreign-owned firms also display higher capital intensity in a larger number of industries than all U.S. establishments.

Differences between foreign-owned firms and all U.S. firms should be viewed with some caution. First, the two groups of firms are not strictly comparable: the group of foreign-owned firms comprises a subset of all foreign firms, which includes primarily very large firms; the group of U.S. firms includes all firms, spanning a broader range of sizes. Secondly, the differences reflect a range of additional factors, including the prospect that foreign firms which invest in the United States likely are large firms with proven technologies or techniques they have successfully transferred to the United States. Small foreign ventures, experimenting with unproven technologies, are unlikely to want the added risk of investing overseas. Foreign investors also tend to opt for larger scale and higher capital-intensity plants than the average U.S. firm to offset the risks inherent in investing abroad and to generate higher profits to make it economical to manage an operation far removed from the parent firm.

Cyclical vs. Structural Changes

The Bureau of Economic Analysis publishes detailed data on a broad range of industries represented by U.S. parent companies and their foreign affiliates. These data are used to compare differences in performance between U.S. parent companies and their foreign affiliates in terms of gross production and employment across a range of industrial sectors during three time periods, representing two periods of fast growth separated by a period of slower growth to measure the performance of U.S. parent firms and their foreign affiliates during these periods. In particular, the data are compared to determine if there has been any noticeable shift in production or jobs from U.S. parent companies to their foreign affiliates in the 1999 to 2002 period, when economic growth slowed in the United States, that is different from what has happened during the 1995 to 1998 period and 2003 to 2008 periods when growth was relatively stronger. The data are then used to determine if shifts in production from parent companies to foreign affiliates can be attributed to structural changes in the economy or to cyclical changes that are associated with the business cycle. Structural changes, for instance, can occur in industries that are maturing and experiencing economies and improvements due to technological improvements, or in declining industries that are shedding jobs and capital. It is not always possible to tell which stage of economic change certain sectors are experiencing, but such a distinction is important in order to understand how direct investment is affecting the economy, and for determining what, if any, legislative prescription would be appropriate.

The data in **Table 8** compare two periods of economic expansion—1995 to 1998 and 2003 to 2008—with the economic slowdown in the 1999 to 2002 period. These three periods are useful for comparing the overall economic performance of U.S. parent companies and their foreign affiliates by examining their rates of growth in output and employment during the first and third periods when the U.S. economy grew at an annual average rate of more than 3% per year and the

later period when the economy grew at an average annual rate of about 2.5%. Economic sectors that are experiencing long-term structural changes would be expected to perform at lower rates during expansions and contractions in the economy, while both declining and expanding sectors would be expected to be affected by cyclical changes in the economy. Although expanding sectors would resume their expansion once the economic downturn had ended. If U.S. parent companies are prone to outsourcing more jobs during periods when the U.S. economy is growing more slowly, then industries that are experiencing long-term structural decline would be expected to show relatively poor economic performance by the parent company in both periods relative to a more robust performance by the foreign affiliates. In contrast, industries that are experiencing strong growth during the expansion part of the business cycle would be expected to show stronger growth in gross product and employment by the parent firms than by the foreign affiliates.

The period between 1999 and 2002 shows the impact a slowdown in the U.S. economy has on the operations of U.S. parent companies. During this period, the U.S. parent companies' average annual gross product decreased by 1%, while the average annual gross product of U.S. foreign affiliates rose by 2.6%, slightly below the average annual rate of growth they experienced in the 1995 to 1998 period. Employment fell among parent companies, mostly in the 2000-2002 period as a result of the slowdown in the U.S. economy, while employment grew on average at a 1.7% average annual rate among the affiliates, a rate that is about one-third the 4.8% average annual rate the affiliates experienced in the 1995 to 1998 period and below the average annual rate of 8.8% increase in employment the affiliates experienced in the 2003 to 2008 period. In contrast, during the 1995-1998 period, parent company's gross product grew at an average annual rate of 5.6%, about twice the rate of the foreign affiliates, although employment among the parents grew by 2.2% during the period, or half the rate of the growth in employment among foreign affiliates as indicated in **Figure 7** and **Figure 8**. These trends make it difficult to detect a general shift of jobs abroad by U.S. parent companies. In many cases, both employment and gross product of the parent firms and the foreign affiliates seem to move in the same general direction. This partial synchronization may reflect the overwhelming impact the U.S. economy has on the global economy due to a growing network of economic and financial ties.

Figure 8. Average Annual Percent Change in Employment of U.S. Parent Companies and Their Foreign Affiliates, Selected Periods

Source: U.S. Department of Commerce.

Gross product in the manufacturing sector fared poorly over the second period, but showed some gains in the 1995 to 1998 period and in the 2003 to 2008 recovery. Output by U.S. parent companies in the later period increased by 2.7% on an average annual basis, while output among the foreign affiliates increased by 2.0%, as indicated in **Figure 9** and **Figure 10**. This performance illustrates the impact a temporary slowdown in the business cycle has on industrial sectors that also are experiencing long-term structural changes. From 1995 to 1998, manufacturing gross product among parent companies increased at an average annual rate of 2.7%, more than twice the rate among the overseas affiliates. Employment among the parent companies, however, fell at an average annual rate of 2% as the U.S. manufacturing sector continued to experience structural changes and a robust increase in productivity. In contrast, employment among the foreign affiliates increased at an average annual rate of 1%, commensurate with their rate of growth in gross product.

During the period 1999 to 2002, when U.S. economic growth slowed, gross product in the manufacturing sector among parent companies fell at an average annual rate of 3.7%, and employment fell at an average annual rate of 2.4%, or fell at a slightly faster rate than in the previous period, likely reflecting the effects of the slowdown in growth combined with the advanced stages of structural retrenchment that had already occurred. In comparison, U.S.-owned foreign manufacturing affiliates experienced a 3.6% increase in average annual gross product, but only a average annual increase in employment of 0.3%. During the recovery of 2003 to 2008, however, gross product among U.S. parent manufacturing companies increased at an average

annual rate of 2.7%, while the foreign affiliates experienced an increase of 2.0%. Despite this recovery in output, U.S. parent companies continued to experience a loss of manufacturing jobs, while the foreign affiliates expanded their employment rolls by an average annual rate of 5.5%.

Figure 9. Average Annual Percent Change in Manufacturing Gross Product of U.S. Parent Companies and Their Foreign Affiliates, Selected Periods

Source: U.S. Department of Commerce.

In other major industries, the results are mixed. The impact on wholesale trade shows the impact of the economic slowdown in the 1999 to 2002 period. In the 1995 to 1998 period, as the U.S. economy expanded, gross product in the wholesale trade sector among parent companies grew at an average annual rate of 26.6% and employment grew at an average annual rate of 16.6%. Among the foreign affiliates in the wholesale trade sector, gross product increased at an average annual rate of 1.2%, but employment increased at an average annual rate of 32.9%. In the 1999 to 2002 period, when the rate of economic growth had slowed, gross product among parent companies increased at an average annual rate of 3%, while employment stayed even. Among affiliates, gross product fell at an average annual rate of 4%, but employment increased by an average annual rate of 5%. In the 2003 to 2008 period, however, both U.S. parent companies and their foreign affiliates experienced a resurgence in the average annual rate of growth in the wholesale trade sector (10.2% and 110.0%, respectively), but employment grew at a much slower average annual rate among the affiliates (3.5%) than among the U.S. parent companies (7.9%).

Figure 10. Average Annual Percent Change in Manufacturing Employment of U.S. Parent Companies and Their Foreign Affiliates, Selected Periods

Source: U.S. Department of Commerce.

Finance, a sector where the United States is generally believed to have a competitive edge, shows a different pattern. In the 1995-1998 period, gross product among U.S. parents in finance grew at an average annual rate of 16.7% and employment expanded by 3.9%. Affiliates in finance experienced similarly robust growth: gross product increased at an average annual rate of 20.4% and employment grew at an average annual rate of 9.58% as U.S. finance firms used their expertise to capture market shares abroad. The finance sector was affected by the slower growth in the economy in the 1999 to 2002 period, as average annual gross product among parent companies grew by 9.5%, compared with an increase of 3.7% for foreign affiliates. During the same period, employment among U.S. parent firms in the finance sector grew by 0.5%, while employment among the affiliates grew at an average annual rate of 6.2%. The response during the recovery period, 2003 to 2008, by both the U.S. parents and the foreign affiliates is unique: gross product among U.S. parents rose at an average annual rate of 0.5% and employment fell at an average annual rate of 8.6%, gross product among the foreign affiliates grew at an average rate of 8.9% and employment grew by 21.4%, likely reflecting the differential effects of the financial crisis on American, European, and Asian finance firms.

In 1999, the Bureau of Economic Analysis changed the composition of industries in its survey to include more high-tech service sectors. Twenty of these sectors are listed in **Table 9**, with data for the 1999 to 2002 period and for the 2003 to 2008 period. During the first period, average annual gross product by parent companies fell in eight of the sectors, reflecting the lower overall rate of economic growth during the period of lower economic growth. Not all of these eight sectors,

however, experienced lower average annual losses in employment. Indeed, in 12 of the sectors, the average annual rate of gross output for the parent firms increased over the 1999 to 2002 period, with most of those sectors experiencing positive increases in employment.

The pattern of the foreign affiliates closely resembles that of the parent firms, with the affiliates experiencing positive rates of growth and employment in about a dozen sectors. Some sectors, though, experienced falling rates of output and employment during the 1999-2002 period and during the 2003-2008 period, reflecting a broader scale of economic decline that extended beyond the economic downturn. In the seven high technology sectors, parent companies regained positive growth and rising employment in all but the communications equipment and semiconductor sectors. The foreign affiliates also experienced a continued decline in gross product in communications equipment sector during the 2003-2008 period. In the 13 services sectors both parent companies and foreign affiliates experienced a rebound in employment in nearly all of the sectors, reflecting the continued growth of the services sectors in the advanced economies.

Trade

Another aspect of foreign direct investment that causes concern is the impact foreign direct investment has on the amount of foreign trade associated with those investments. Some observers argue that U.S. direct investment abroad supplants U.S. exports, jobs, and research and development funds, thereby reducing employment and wages in the U.S. economy. Others are concerned that outward direct investment alters the industrial composition of domestic production and trade flows, which can affect the sectoral and regional distribution of employment and the relative demand for skilled and unskilled labor.²⁰ According to this scenario, as firms invest abroad, they shift production abroad and replace U.S.-based production with exports back to the United States, thereby eliminating jobs in the United States. As production shifts abroad, jobs are lost in the United States and goods that once were produced in the United States are now imported from abroad. However, most studies indicate that, on balance, direct investment abroad increases U.S. exports and helps sustain employment and wages at home.²¹

If foreign direct investment is a substitute for trade and replaces jobs in the parent company, it would be reasonable to expect the share of intra-firm trade to increase over time along with the flow of foreign investment. Such intra-firm trade represents trade between U.S. parent companies and their foreign affiliates and the U.S. affiliates of foreign firms and their foreign parent company. In particular, if foreign investment is displacing jobs and domestic production, or outsourcing jobs, it would be reasonable to expect imports from U.S. foreign affiliates to the U.S. parent company to increase over time as a share of total trade. There is little doubt that some firms do indeed replace domestic production with production from abroad, which would shift trade patterns, but the share of U.S. trade represented by U.S. parent companies and their affiliates since the 1990s did not increase as would be expected. Instead, as indicated in **Figure 11**, intra-firm exports and imports fell as a share of total U.S. exports and imports during the 1990s. From 2000 to 2003, intra-firm trade, both exports and imports, increased as a share of total U.S. exports and imports respectively, but since 2003, intrafirm trade in exports and imports has trended downward as a share of total U.S. exports and imports.

²¹ *Ibid.*, p. 101; Brainard, S. Lael, and David A. Riker, *Are U.S. Multinationals Exporting U.S. Jobs?* NBER Working Paper 5958, National Bureau of Economic Research, March 1997.

Figure 11. Intra-Firm MNC Trade as a Share of Total U.S. Exports and Imports, 1990-2008

Source: U.S. Department of Commerce.

As **Table 10** indicates, the share of U.S. exports shipped by U.S. parent companies peaked at 67% in 1994, but dropped to 45% in 2008. Similarly, the share of U.S. exports shipped by the U.S. affiliates of foreign parent companies fell from 23% in 1992 to 18% in 2008. In addition to the decline in the overall share of U.S. exports, intra-firm trade, or exports from U.S. parent companies to their foreign affiliates, fell from 25% of U.S. exports in 1992 to 21% in 2008, as exports to firms not associated with the parent firm increased. The exports of U.S. affiliates of foreign firms to their foreign parent companies has remained steady at about 9% from 1992 to 2008. Similarly, total intra-firm exports fell from 35% of U.S. exports in 1992 to 30% in 2008. The intra-firm share of U.S. exports remained relatively stable during the economic downturn in the early 2000s, suggesting that such intra-firm trade is more stable than exports as a whole, so that its share rises or falls as U.S. exports fall or rise, respectively, with business cycle conditions.

On the import side, intra-firm trade has also declined as a share of total U.S. imports, defying the notion that U.S. firms are supplanting U.S. production with imports by outsourcing production abroad. Until recently, intra-firm imports has remained fairly stable as a share of total U.S. imports as indicated in **Table 11** Imports shipped to U.S. parent companies fell from 41% of total U.S. imports in 1992 to 33% of U.S. imports in 2008. Similarly, U.S. imports by the U.S. affiliates of foreign firms fell from 35% of U.S. imports in 1992 to 26% of U.S. imports in 2008. In addition, intra-firm imports, or imports from the foreign affiliates of U.S. parent companies to those parent companies fell from 17% of total U.S. imports to 12% of U.S. imports from 1992 to 2008, which raises questions about the concept of U.S. outsourcing of production abroad replacing U.S. domestic production. During the same 1992-2008 period, imports from foreign parent companies and their associated affiliates (collectively known as the foreign parent group) to their U.S. affiliates fell from 35% to 26% of U.S. imports, so that intra-firm imports as a whole fell from 43% of total U.S. imports to 33%, due in part to imports shipped to importers outside the intra-firm trade relationship. These data do not seem to conform with the argument that U.S. firms have shifted some production facilities abroad and have supplanted domestic production

with imports. At the same time, data are not conclusive and may also indicate that foreign investment can stimulate foreign sales, which boosts domestic production and mitigates the economic impact of foreign outsourcing.

Sales

Another way of viewing the impact foreign direct investment has on U.S. jobs is by examining the sales patterns of U.S. multinational companies. If U.S. parent companies are embarking on a more extensive effort to outsource jobs abroad, it is reasonable to expect that this pattern would affect the sales from these foreign affiliates to the U.S. parent company or that sales to other U.S. persons of foreign-sourced goods would increase over time. In addition, some observers are concerned that certain types of service jobs are being moved abroad with service activities being outsourced to foreign workers. The BEA data on sales of U.S. multinational companies, however, follows a pattern similar to that of the trade patterns of these companies and does not offer conclusive evidence in support of an increase in jobs or activities being outsourced abroad.

As **Table 12** indicates, the foreign affiliates of U.S. parent companies had \$5.2 trillion in sales in 2008. The largest share of affiliate sales—about 60%—is in the local market where the affiliate is located. U.S. parent companies also use their foreign affiliates as a springboard to increase sales in neighboring areas or countries. Such sales to other foreign countries in 2008 accounted for about 30% of the affiliates’ sales. European affiliates, which accounted for about half of all affiliate sales, also accounted for the lowest share of their sales back to the United States, where over 40% of their sales is to other foreign countries, mostly to other countries within the European Common Market. Out of all U.S. affiliate sales, 7.9% of those sales was shipped back to parent firms in the United States, a share that has remained quite stable over the last decade, and another 2.1% of their sales were to other U.S. persons, or to importers that are not directly associated with the parent company.

Affiliates located in the Middle East, which accounted for the lowest amount overall of affiliate sales, sent 14% of their goods back to the parent firm in the United States. A large part of these sales originated in Israel, which has had a free trade agreement (FTA) with the United States since 1985. Among all the regions, sales by affiliates in Africa are most evenly spread among sales to the United States, local sales, and sales to other foreign countries. Canada represents the most unequal distribution of sales, with 75% of affiliate sales taking place in Canada. Sales by European affiliates are heavily concentrated within Europe: sales either in the local area or to neighboring countries account for 93% of all sales by European affiliates. Sales by affiliates in Latin America are dominated by local sales, which accounted for about 60% of total sales, with about 13% of sales sent to the United States, and 25% is sent to other foreign countries, likely within the region.

Sales by industry indicate that manufactured goods account for about half of all affiliate sales and that about 9% of these goods are shipped back to the United States. The largest share of sales by industry that are accounted for by sales to U.S. parent companies is in the mining industry, as U.S. parent companies have invested abroad in order to gain access to raw materials. All other industries show low levels of sales back to the U.S. parent, with a heavy concentration of sales in the local market and to other nearby foreign countries.

Sales of Services

For some observers, another concern is that U.S. parent firms have started moving service jobs offshore, or outsourcing, in sectors that once were thought to be immune to such activities.²² A report published by the National Academy of Public Administrators (NAPA) on the impact of foreign investment on the services sectors, especially on services involving advanced science and engineering education concluded that, “services off-shoring has had little economic impact on the S&E (science and engineering) labor market, education of S&E workers, or S&E career choices of American students.”²³ As **Table 13** indicates, U.S. foreign affiliates had \$841 billion in services sales in 2008. Of this amount, 4.9% consisted of service sales back to the U.S. parent company. The largest share—74%—of sales of services were made in the local market. This share is substantially higher than the comparable share for sales of goods and services combined and is consistent with the general view that the distinguishing feature of services is that they are consumed where they are produced. Latin America and the Middle East are the areas with the highest share of sales back to the U.S. parent companies, while Asia and Europe represent the areas with the lowest share of services sales back to the U.S. parent. The Commerce Department has suppressed a large amount of the data on sales of services by industry in order to protect the

confidentiality of individual firms, but the highest share of service sales in the local market is in the areas of finance and insurance and information. The strong sales of financial services is not unusual, however, given the general conclusion that U.S. financial services companies are among the most competitive in the world.

Although the dollar amount of sales of services back to the United States by U.S. foreign affiliates is low compared to the overall amount of sales of services, as **Table 14** indicates, the rate of growth in the sale of services back to the U.S. parent has been among the highest of service sales to all areas. Between 1999 and 2002, when the U.S. economy was slowing, the average annual rate of growth in the sales of services back to the U.S. parent company grew by 11%, based mostly on sales by affiliates in Europe. The average annual rate of growth in the sales of services from affiliates in Africa fell by 11%, while sales from other areas rose slowly.

In the 2003 to 2008 period during which the pace of U.S. economic growth picked up relative to the previous period, the overall average annual rate of growth in the sales of services rose by nearly 75%. Similarly, sales of services to U.S. parent companies rose by 93%, or at nearly eight

times the rate experienced in the previous period. The average annual rate in the sale of services back to the United States grew at especially rapid pace from affiliates in Canada and Africa. Overall, the average annual rate in the sales of services to the local markets grew by about 12%, still more than double the rate experienced in the previous period. Sales of services to other foreign countries, however, fell from 37% to 24% as sales to the U.S. parents and in the local market absorbed the largest share of production of services sales.

Research and Development

National governments and many state and local governments spend considerable amounts of money attracting foreign direct investment under the belief that such investment has a positive impact on their respective economies.²⁴ Although various academic studies have found that such “spillover” effects appear to be small, a 2003 study challenges these conclusions.²⁵ The authors argue that technology spillovers from foreign direct investment to U.S.-owned manufacturing firms accounted for about 11% of the growth in productivity in the U.S. firms between 1987 and 1996. In addition, as **Table 15** indicates, foreign firms generally spend more on high-technology research and development within the United States than U.S. firms spend abroad. All three types of R&D spending indicated in the table experienced a slowdown in R&D spending in 1991, 2002, and 2008 in response to the slowdown in economic growth in those periods. Other than those three years, however, R&D spending in nominal terms has increased every year by all three types of firms. In addition, affiliates of foreign firms operating in the United States outspent the foreign

Why Firms Invest Abroad

Foreign direct investment challenges a number of concepts economists hold about international capital flows. Most explanations of such capital flows argue that direct investment is just another form of international capital flows and that capital flows to locations where the rate of return is the highest. While this may be true in a general sense, the bulk of foreign direct investment takes place between highly developed countries where rates of return are very similar. In addition, those countries that are large investors are also recipients of large amounts of direct investment and investment flows into and out of these countries seem to move together, so that those economic

conditions that encourage inflows of direct investment also promote outflows of direct investment.²⁶

Economists generally believe that firms invest abroad to increase their profits. They are less certain about which factors trigger the initial investment decision, about why firms choose to invest where they do, and about what distinguishes firms that invest abroad from those that remain purely domestic. In most cases, economists conclude that a broad range of factors influence a firm's decision to invest abroad that include far more than a simple search for low-cost labor. The United Nations characterizes the major determinants of foreign direct investment as the confluence of three sets of determining factors that exist simultaneously: (1) the presence of ownership-specific competitive advantages in a transnational corporation, (2) the presence of locational advantages in a host country, and (3) the presence of superior commercial benefits in an intra-firm as against arm's-length relationship between investor and recipient.²⁷

For some observers, foreign direct investment seems to be characterized by a relatively simple process of firms seeking out low-cost production locations and low-cost resources, including low-cost labor. Multinational firms, however, are motivated by more than a single factor, and likely invest abroad not only to gain access to a low-cost resource, but to improve their efficiency, or to improve their market share. In all, direct investment is a complex activity that involves a long-term commitment to a business venture in a foreign country that requires the coordination and management of considerable resources and assets across countries. The relative importance of characteristics that determine where investments are located depend on a broad range of factors that can change over time and with economic conditions. Although low-cost abundant labor is a principal resource that some firms seek, academic studies of foreign direct investment indicate that it is always labor plus other advantages, particularly industrial infrastructure, that influence a firm's investment decision. Based on observations through 1998, the United Nations concluded that investments based solely on low-cost labor have been highly mobile and have increased dramatically the risk of losing any locational advantage based on just that factor alone.²⁸

According to the United Nations, technological improvements in the area of telecommunications and computers have helped to make it possible for firms to extend their efficiency strategies across national borders. When firms undertake competitiveness-enhancing foreign direct investment, they seek not only cost-reductions and bigger market shares, but also access to technology and innovative capacity, which can be highly influenced by national policies. Nations that are successful in attracting direct investment generally possess such infrastructure facilities as high-quality telecommunications links, reliable transportation systems, and such skills as accountancy, legal services, purchasing and marketing, finance and R&D capabilities, and large markets.²⁹

At times, economists have puzzled over the presence of foreign direct investment, because it seemed unthinkable to most of them that nations would simultaneously import and export the same good and that investments would occur within the same industry between two different trading countries and by the same company. For some economists, trade and investment were

²⁶ Lipsey, Robert E., *Interpreting Developed Countries' Foreign Direct Investment*. NBER Working Paper 7810. National Bureau of Economic Research, July 2000. pp. 3-4.

²⁷ World Investment Report 1998: Trends and Determinants. United Nations, New York, 1998. p. 89.

²⁹ *Ibid.*, p. 108-109.

thought to be opposites; therefore, as long as international trade was free, there was no reason for international investment to occur. These economists based their conclusions on the argument that free trade caused commodity prices between countries to converge. Such a convergence was expected eventually to equalize wage rates and rates of return on investments and to make investing abroad of little economic value.³⁰ These observations have not been borne out over time as foreign direct investment has become a prominent feature of the globalization process. This suggests that a complex set of factors account for the continued presence of foreign direct investment.

Ownership-Specific Advantages

Economists generally argue that foreign investment is a viable option for some firms due to economic advantages that arise from a unique set of characteristics that are related to specific types of firms. These characteristics include managerial ability, technical advantages, or market strength, which give firms an incentive to invest abroad and to provide the advantages necessary to be competitive in markets at home and abroad.³¹ These analysts conclude that market imperfections and firm-specific factors³² give some firms economic advantages over their competitors that allow them to attain an oligopolistic position in their home and in foreign markets and to increase their market shares. Such firms possess a competitive advantage over their foreign competitors or they would be incapable of overcoming the disadvantages of operating in a foreign market—additional costs associated with managing an enterprise at some distance, and added political and economic risks. Some of the potential advantages that firms might enjoy could arise from market imperfections and from firm specific advantages that arise from producing in large quantities (economies of scale),³³ the market power of the firm,³⁴ the

³⁰ This result, known as the factor-price equalization theorem, is a fundamental result in the theory of international trade. It states that, under certain conditions, free trade will equalize the prices of goods between trading countries. When goods' prices are the same, this theorem states, the prices of the factors of production (labor and capital) will also be equalized. This result is based on a number of assumptions: nations share similar production technology; there is a free international flow of capital and labor; there are perfectly competitive goods and price clearing markets; and consumer tastes do not change with changes in income. For a detailed presentation, see Silberberg, Eugene. *The Structure of Economics*. New York, McGraw-Hill, Inc., 1990. p. 553-554.

absolute size of the firm,³⁵ cost advantages that arise from patents or other special advantages, or from product-specific advantages (product differentiation).³⁶

Location Advantages

Foreign direct investment may also be one step in a series of actions multinational firms take to grow or to remain competitive by gaining access to new markets.³⁷ Some of these actions may be related to gaining access to markets that are protected by high tariffs or by other economic barriers.³⁸ In some cases, foreign investment is driven by a product cycle process that starts in the introduction of a new product and in the growth of market shares.³⁹ At this early stage, product innovations serve as a basis for market advantages over competitors and production is centered in the home country, with foreign subsidiaries acting primarily as marketing agents.

In later phases, competition increases as the innovation is acquired by other producers. In this stage, businesses invest abroad in order to maintain the market shares they gained through exporting. As a result, the transition from exporting, to assembling, to producing in the foreign market may be a natural process, with foreign investment being the facilitating link. While some of the motivation for shifting production abroad may be to avoid tariffs, or other export restraints, lower transportation costs and proximity to the foreign market are important considerations.⁴⁰ This shift is apparent in U.S. direct investment abroad where large shares of foreign production are consumed in the local market or shipped to neighboring countries, rather than being exported back to the United States.

Evidence indicates that there is little empirical basis for expecting a universal linkage between foreign investment and trade.⁴¹ If there is a tendency for overseas production to substitute for some exports from an area, it appears to be offset by influences that tend to increase exports of related products or services.⁴² Studies show that the higher the level of output by a U.S. firm in a

foreign area, the higher are the firm's exports from the United States to that area and the smaller are the exports of other foreign firms. This pattern may be influenced by the host country's trade policy, which may discourage imports, thereby encouraging the affiliates of foreign companies to produce locally.⁴³ Moreover, multinational companies may gain added economic flexibility as a result of their foreign subsidiaries, which allows the parent companies to alter their sources of inputs in response to cheaper imports: instead of altering prices of domestically produced goods to remain competitive. Multinational firms also tend to shift the source of their production to their offshore subsidiaries.⁴⁴

Commercial Benefits

The decision to invest abroad also represents a critical strategic move for a company operating in a global industry—a move that the company determines jointly with the use and development of its production and distribution facilities worldwide.⁴⁵ In some cases, these investments can span a number of locations and production stages through a multi-layer supply chain. Such macroeconomic factors as monetary and fiscal policies have been found to be prime determinants not only of U.S. trade performance but also of a firm's investment behavior through their influence on exchange rates, prices, and wage and productivity behavior.⁴⁶ These and such other external conditions as relative growth rates among national economies, exchange rate movements, productivity, trade restraints, and the desire to acquire technology⁴⁷ are among the most important factors in determining foreign investments. As a result of these market conditions,⁴⁸ multinational firms compensate for such market failures as poorly developed or non-functioning capital or labor markets, by investing abroad and by shifting resources among their foreign subsidiaries. The importance of these factors in motivating direct investment varies over time and among companies and foreign markets. For example, economists trace much of the surge of U.S. direct investment into Common Market countries in the late 1950s and the 1960s to attempts by U.S. companies to avoid trade barriers, to expectations of an increased rate of economic growth in these countries, and to efforts to overcome the perceived overvaluation of the

dollar. Once these initial investments were established, a high level of earnings from them continued to be reinvested, probably to maintain market shares and profit margins.⁴⁹

Additional analyses indicate that foreign investment and, therefore, foreign production, may allow corporations to reduce such risks as bad weather, national business cycles, strikes, and changes in government policies.⁵⁰ Recent analysis suggests that the establishment of foreign subsidiaries can give multinational companies added flexibility in setting their prices in response to increased competition or to such other factors as changes in exchange rates.⁵¹ This may include the ability to switch among their various subsidiaries in supplying major markets to maintain their competitive position without altering the market price of their goods.⁵² As a result, local prices may grow less sensitive to changes in the costs of imports. Linkages between the foreign affiliates and the parent companies apparently allow the affiliates to curtail price changes, which might erode their price competitiveness, during periods of fluctuating exchange rates in order to maintain or even to enlarge their market shares in foreign countries.⁵³

Conclusion

This report utilizes a broad collection of data on direct investment published by the Bureau of Economic Analysis of the U.S. Department of Commerce to assess the impact of U.S. direct investment abroad and foreign direct investment in the United States on the U.S. economy. These data were analyzed to determine if U.S. parent companies are shifting jobs abroad in a way that is different or unique from previous experiences with such investment. Data published by the BEA are the most extensive set of published data on foreign investment activities, but they were not developed to address the issue of jobs outsourcing and it is not possible with the BEA data to track job losses or gains in specific industries, specific companies, or specific plants with changes in jobs abroad. Broad, comprehensive data on U.S. multinational companies published by the BEA lag behind current events by two years, which means that assessing these activities may seem to be out of sync with the more limited anecdotal examples that appear in the popular press and raises questions about the relevancy of the data to assessing short-term developments compared with long term trends.

Despite these caveats, the data offer no conclusive evidence that current investment trends are substantially different from those of previous periods. A comparison of gross product and employment between U.S. parent companies and their foreign affiliates over three distinct time periods indicates that U.S. business cycles have a stronger impact on U.S. parent companies than on the foreign affiliates, but that even the affiliates are affected. Any long-term structural changes that are occurring in the economy apparently are reinforced by the business cycle in the economy, but these same business cycles affect the foreign affiliates. As a result of this partial

synchronization effect, U.S. direct investment abroad and foreign direct investment in the United States generally move in the same direction. From the data examined, it is not apparent that U.S. parent companies are systematically outsourcing jobs at a faster pace or in a manner that is fundamentally different or distinct from previous periods. An increase in economic growth in the U.S. parent companies relative to the rate of growth in the foreign affiliates likely increases pressure within the economy to complete structural changes and to shift capital and labor from declining sectors to expanding sectors. Such changes may also lead to a greater number of jobs being outsourced, but this effect likely would be muted by the overall strong demand for jobs within the economy and by new foreign investments in the economy.

On the other hand, an economic slowdown among U.S. parent companies relative to the rate of growth among foreign affiliates likely would lead to an overall decline in employment throughout the economy. This overall decline in employment would make it difficult to distinguish between those sectors that are undergoing long-term structural changes compared with those sectors that are experiencing short-term job losses due to the relatively slower rate of economic growth. U.S. parent companies may or may not respond to the economic slowdown by outsourcing jobs abroad because the dominating presence of the U.S. economy in the world economy means that an economic slowdown in the United States likely reduces economic growth abroad as well and that the foreign affiliates of those parent companies may not be a position to add more jobs. The uneven effect of an economic slowdown among U.S. parent companies on their investment behavior abroad likely means that jobs outsourcing may appear to be more acute during periods in which the long-term structural changes in the economy coincide with the short-term economic adjustments that arise from a slowdown in the rate of growth of the U.S. economy.

Trade and sales data also indicate that there is no perceptible change in previous patterns that would signal a shift toward a greater emphasis on foreign production and imports. In fact, BEA data indicate that intra-firm trade has declined over the last decade. Although not conclusive, this result is contrary to what would be expected if U.S. parent companies were outsourcing a greater share of their production abroad and importing more goods from their foreign affiliates. These results also seem to challenge estimates that predict a large shift of jobs abroad over the next half decade.

Concerns about the currency of BEA do not seem to be warranted. One characteristic of U.S. direct investment abroad and foreign direct investment in the United States is the relative stability in the patterns of that investment over time. This pattern is unlikely to change over a short period of time, so that the lag in publication of BEA data is unlikely to alter appreciably any general conclusions about the role of direct investment in the economy. A large share of U.S. direct investment abroad remains concentrated in the most highly developed economies and the share of jobs supported by the foreign affiliates comprises a small share relative to the U.S. economy. Employment and jobs in the U.S. economy continue to arise from economic factors that are unique to the U.S. economy and to U.S. economic policies. On average, U.S. foreign affiliates are expected to continue to produce about 300,000 jobs a year, a small share of the average number of jobs produced by the U.S. economy during any given year.

For Congress, the data on direct investment seem to indicate that the number of jobs created by U.S. parent companies and by the foreign affiliates of those parent companies is tied closely to the overall performance of the U.S. economy. Such economic measures as employment, trade, and investment will rise and fall among U.S. parent companies and their foreign affiliates generally in tandem. Swings in the rate of growth in the economy that are associated with the business cycle tend to affect U.S. parent companies more than they affect their foreign affiliates

and more than those U.S. firms that are purely domestic firms. Policies that ameliorate the business cycle, especially the downside of the cycle when the economy is experiencing a slow rate of economic growth, likely would do the most to help U.S. parent companies. Furthermore, Congress may choose to address the economic plight of those workers and communities that experience a disproportionate share of the adjustment costs that are associated with the business cycle by providing specialized assistance or other types of short-term support.

Workers and communities that are involved with economic activities that are facing long-term structural decline may require support to assist displaced workers regain employment or to find new business partners to sustain economic development in those communities. Workers in industries that are undergoing long-term structural decline may well see production and jobs move abroad. Addressing such long-term structural decline, however, is especially challenging, because the economic forces that are working against such industries can be immense..
