LEGISLATION

SUMMARY

On June 28, the Senate approved its version of H.R. 6, the Energy Policy Act of 2005 (85-12). The House passed its version of H.R. 6 on April 21 (249-183). The Senate and House bills are similar, but major differences exist, including the following areas.

Ethanol and MTBE. The House bill includes a “safe harbor” provision to protect methyl tertiary-butyl ether (MTBE) refiners from product liability suits, while the Senate bill does not. It is a controversial provision; there are reports that it could be dropped from H.R. 6 and added to highway legislation (H.R. 3) in conference. Both bills would repeal the Clean Air Act requirement for oxygenated gasoline that led to the use of MTBE, and both would require refiners to use biofuel (presumably mostly ethanol), but the House bill sets a goal of 5 billion gallons per year by 2012 and the Senate bill would require 8 billion gallons.

ANWR. Leasing of part of the Arctic National Wildlife Refuge (ANWR) for oil and gas development would be permitted by a provision in the House bill, but not in the Senate bill. However, on April 28 the House and Senate approved a final budget resolution implicitly calling for ANWR to be opened to provide oil and gas leasing revenue.

Electricity Restructuring. Both the House and the Senate bills would repeal the Public Utility Holding Company Act (PUHCA), but the Senate bill has provisions for more stringent oversight of utility mergers than the House version.

Renewable Energy. The Senate bill includes a “renewable portfolio standard” (RPS) requiring utilities to generate at least 10% of their electricity from renewable energy sources by 2020. The provision was rejected by the House in passing its bill.

Climate Change. The Senate bill would establish a credit-based deployment program for technologies to reduce greenhouse gas intensity and establish programs to deploy technologies in developing countries. The House bill does not contain climate change provisions.

Tax Provisions. The Administration’s FY2006 budget request calls for a limit of $6.7 billion in energy tax credits. The tax incentive provisions of the House-passed H.R. 6 have an estimated cost of $8.1 billion. The Senate tax provisions in H.R. 6, valued at $14.1 billion over 11 years, include more incentives for conservation and renewables than the House bill.

Outer Continental Shelf. The Senate version of H.R. 6 would require an inventory of oil and natural gas resources on the Outer Continental Shelf (OCS). The House-passed H.R. 6 also makes no changes to existing OCS leasing moratoria, but does not call for a resource study.

Siting of LNG Terminals. Provisions to permit the Federal Energy Regulatory Commission (FERC) to decide on the siting of liquefied natural gas terminals are opposed by some as an override of states’ rights. An amendment to eliminate these provisions from the House bill had insufficient support (194-237). A similar amendment was tabled during floor debate in the Senate on June 22 (52-45).
MOST RECENT DEVELOPMENTS

On June 28, the Senate approved its version of H.R. 6, the Energy Policy Act of 2005 (85-12). The House passed its version of H.R. 6 on April 21 (249-183). The Senate bill is similar to the House-passed version, but major differences exist.

The most controversial difference between the House and Senate energy bills in the 108th Congress was the inclusion in the final bill of a “safe harbor” provision favored by many House members. The provision, which would protect methyl tertiary-butyl ether (MTBE) refiners from product liability suits, is once again in the current House energy bill, but not in the Senate version. There have been reports of negotiations to achieve a compromise that would be acceptable to a majority of the Senate in the 109th Congress. There have also been reports that the “safe harbor” provision would be dropped from the energy bill and possibly attached to highway legislation (H.R. 3) currently in conference.

The two different versions of the bill will go to conference.

BACKGROUND AND ANALYSIS

(Note: The House and Senate have designated the Energy Policy Act of 2005 in the 109th Congress as H.R. 6, the same number as the energy bill considered in the 108th Congress. References to H.R. 6 in the 108th Congress are designated by [108] following the bill number.)

Since the time of the Arab oil embargo in 1973-1974, the United States and other major energy consumers have achieved greater efficiencies in energy use in all sectors of the economy. However, national and world energy demand continues to grow, and domestic oil production in the United States continues to decline as the more accessible resources of crude from U.S. fields in Alaska and elsewhere have been tapped. As a consequence, the gap between U.S. production and consumption has had to be covered by increased oil imports. These imports, roughly 6 million barrels per day (mbd) daily after the Arab oil embargo, now exceed 10 million mbd daily after the Arab oil embargo, now exceed 10 million mbd to satisfy U.S. oil consumption of nearly 21 mbd.

As with any commodity, the price of crude oil and petroleum-based products can be volatile. In the last few years, a number of factors have contributed to sharp increases in the price of oil. Demand for petroleum by developing nations and the Far East had put pressure on current world production and refining capacity. Attacks upon Iraqi pipelines supplying oil to world markets, and a general uncertainty about stability in the Middle East, have also contributed to nervousness in world oil markets. Inventories of crude and some petroleum product inventories were already below year-earlier levels, and were continuing to decline.

1 For a more thorough review of energy policy since the mid-1970s and a broader framework for the current debate, see CRS Report RL31720, Energy Policy: Historical Overview, Conceptual Framework, and Continuing Issues.

or hold steady, raising the specter of home heating oil shortages if winter 2004-2005 proved to be a cold one. A major factor contributing to high prices was Hurricane Ivan, which rampaged through the Gulf Coast in mid-September, and temporarily shut down more than 70% of U.S. offshore crude production, affecting crude oil deliveries to refineries. Inventory levels of crude oil and petroleum products declined. In late June, crude oil prices exceeded $60/barrel for the first time on supply concerns and uncertainty following the election of Mahmoud Ahmadinejad, a man regarded as a “hard-liner,” to the presidency of Iran.

Some of the decline in domestic production has been partially offset by growing production from “deep water” fields in the Gulf of Mexico that now exceeds 900,000 barrels daily, or roughly 60% of all production from the Gulf. Deep water production is projected to reach 2.25 million barrels daily by 2010. The Minerals Management Service of the Department of the Interior has estimated potential deep water reserves of 56 billion barrels.3

Though crude oil prices have not met or exceeded in real terms historic highs for oil prices, they have been frequently referenced in the debate. While energy policy touches on many problems other than fossil fuel supply and demand, the price of oil — gasoline and home heating oil in particular — is often the lever that spurs policymakers to discuss national energy policy and to seek legislative initiatives to increase the supply of conventional fuels, promote the development and use of alternative and renewable fuels, push for improvements in efficiency of energy consumption, assure greater reliability in the electric utility sector, and review existing and possible new incentives in the tax system to promote change in how the nation uses energy. Not surprisingly, national energy policy received significant attention during the 108th Congress.

Comprehensive energy legislation was reported from conference in the 108th Congress in November 2003 and approved by the House shortly thereafter, but was not approved by the Senate. Discussion of breaking out less controversial provisions was resisted by the House and Senate leadership. They argued that the bill that had been crafted was a careful balance of competing visions; breakup would leave more controversial provisions without leverage for compromise. The main exception was that some energy tax incentives were extended or adopted in the Working Families Tax Relief Act of 2004 (P.L. 108-311) and the American Jobs Creation Act of 2004 (P.L. 108-357).

Major concerns in the Senate were the cost of H.R. 6 [108] — estimated at around $31 billion over 10 years — and a provision insisted upon by the House that would have protected producers of methyl tertiary-butyl ether (MTBE) and renewable fuels from liability for personal injury, property damage, and cleanup. Early in the second session of the 108th Congress, a comprehensive bill (S. 2095) with a cost of roughly $14 billion was introduced in the Senate, but did not reach the floor. Another controversial issue has been establishment of a renewable portfolio standard (RPS) that would require utilities to use more renewable fuel sources to generate electricity. Language to open up the Arctic National Wildlife Refuge (ANWR) to oil and gas development was not included in H.R. 6 [108].

Similar language is in the version of H.R. 6 passed by the House on April 21, 2005. At his confirmation hearing on January 19, 2005, before the Senate Committee on Energy and

3 [http://www.gomr.mms.gov/homepg/offshore/deepwtr.html].
Natural Resources, Energy Secretary Samuel Bodman indicated that he would press for passage of an energy bill that would include provisions to open ANWR to leasing and development. The FY2006 budget transmitted to Congress by the Bush Administration supports opening ANWR to exploration and development. The budget projects bonus bid revenues at $2.4 billion, half of which would accrue to the federal government and the balance to Alaska. On March 9, 2005, the Senate Budget Committee issued a budget resolution that assumes $2.5 billion of revenue over five years from leases in ANWR, and would allocate $2.0 billion in mandatory spending to comprehensive energy legislation and $4.5 billion for energy tax incentives. On March 16 the Senate rejected an amendment by Senator Cantwell to strike the ANWR provisions, by a vote of 49-51. The next day the Senate passed the budget resolution (S.Con.Res. 18). The House version of the budget resolution (H.Con.Res. 95) passed on March 17 did not include ANWR provisions, but they are a part of the Energy Policy Act of 2005 passed by the House on April 21, 2005. On April 28, the House and Senate approved a final budget resolution with reconciliation instructions requiring that the Senate Committee on Energy and Natural Resources and House Committee on Resources find $2.4 billion in savings through FY2010, implicitly calling for authorization of exploration and development in ANWR.

Little in the conference version of H.R. 6 [108] would have addressed price and supply issues in the near term — largely because there are very few policy options to address price volatility. Many policymakers have characterized the Energy Policy Act of 2005 passed by the House on April 21, 2005, similarly. In public remarks during the latter part of April 2005, the President acknowledged that the bill would not affect energy prices in the near-term.

However, to the extent that production and refining capacity exists, high prices can encourage additional supply. The Low Income Home Energy Assistance Program (LIHEAP) can provide financial support to households overwhelmed by high prices. In the event of a price increase caused by a shortfall in physical supply of crude or home heating oil, the Strategic Petroleum Reserve (SPR) and the Northeast Heating Oil Reserve (NHOR) might be tapped.

It is difficult to achieve widespread consensus on national energy policy. Constructing a balanced energy policy that will not undermine other competing and equally legitimate policy goals is a complex undertaking. There is controversy about the impacts of energy development on the environment, and policymakers have different positions about the extent to which tradeoffs should be risked. Because of the regional diversity of the United States, some policy options are not perceived to serve all regions of the nation advantageously. These considerations help to explain why the time-consuming crafting of a comprehensive bill in the 108th Congress was perceived to represent a fragile balance between competing interests.

The fashioning of comprehensive energy legislation is also made more difficult by the very price volatility that renews interest in national energy policy. A review of the course of energy prices since the time of the Arab oil embargo and first oil price shock in 1973 reveals that it is a more proximate characterization to see this 30-year period as one of general price and supply stability that is periodically broken by shorter episodes of supply disruption and price volatility. It is not so much that energy policy has failed to be responsive to crises; rather, during lengthy periods of stability and declining prices for conventional
fuels, it has proven difficult to sustain certain policy courses that might help shield the nation from the occasional episodes of instability.

**109th Congress.** On April 13, 2005, several House committees finished markup of their respective portions of comprehensive energy legislation — the House Committee on Energy and Commerce, the Committee on Resources, and the Committee on Ways and Means. For the most part, attempts by the minority to significantly amend the language of the committee bills were unsuccessful. Debate on the Energy Policy Act of 2005 (H.R. 6) began April 20, 2005, and the legislation was passed (249-183) the following day. Some of the major features of H.R. 6 are discussed below. Overall, the Energy Policy Act of 2005 as passed by the House and the comprehensive legislation reported from conference in the 108th Congress, but not enacted, are very similar. Important differences are the ANWR language, fewer energy tax incentives, and inclusion of a refinery revitalization program that was passed by the House (H.R. 4517) during the 108th Congress, but not by the Senate.

One of the major issues has been the cost of legislation providing energy tax credits. The bill that went to conference in the 108th Congress (but was not enacted) included more than $30 billion in tax credits. Some energy tax incentives were subsequently extended or adopted in the Working Families Tax Relief Act of 2004 (P.L. 108-311) and the American Jobs Creation Act of 2004 (P.L. 108-357). The Administration’s FY2006 budget request calls for a limit of $6.7 billion in energy tax credits. The estimated cost of the provisions in H.R. 6 is $8.1 billion over 11 years. The Senate Finance Committee tax provisions added to the Senate version of H.R. 6 include more incentives for conservation and renewables than the House bill, and are estimated to cost $14.1 billion over 11 years.

The House legislation would open the Arctic National Wildlife Refuge (ANWR) to exploration and development. An amendment on the floor of the House to delete ANWR from H.R. 6 was defeated (200-231). The House legislation includes a “safe harbor” provision to protect methyl tertiary-butyl ether (MTBE) refiners from product liability suits, which was narrowly retained after a close vote on an amendment that reached the floor to drop the language (213-219). In the 108th Congress, this provision was included in the bill that was reported from conference. However, there was opposition to this provision in the Senate and it had a significant role in the defeat of the conference bill at the end of the first session of the 108th Congress. There have been reports of negotiations to achieve a compromise that would be acceptable to a majority of the Senate in the 109th Congress. There have also been reports that the “safe harbor” provision would be dropped from the energy bill and possibly attached to highway legislation (H.R. 3) currently in conference.

On February 10, 2005, the House Science Committee reported H.R. 610, which includes less controversial research and development provisions that were part of comprehensive legislation debated in the 108th Congress. That legislation, approved by voice vote, would authorize roughly $44.1 billion over five years for research of deep sea drilling, clean coal technology, nuclear energy, fusion technology, and high-performance computers. The bill also would authorize funding to improve energy efficiency of vehicles and buildings. These provisions are also a part of the House version of H.R. 6.

In an address on energy policy on April 27, 2005, President Bush, proposed that new refineries be built on the site of closed military facilities, and that federal tax credits on the purchase of hybrid vehicles be extended to vehicles burning clean diesel fuel. The President
offered the services of the Administration to assist in helping to reconcile controversial issues that might be standing in the way of enacting legislation.

The Senate Committee on Energy and Natural Resources ordered reported comprehensive energy legislation on May 26, 2005, and the bill was introduced as S. 10 (S.Rept. 109-78) on June 9. Floor debate began June 14, and the text of S. 10 was substituted for H.R. 6. Cloture was approved (92-4) on June 23. Work was largely completed on the bill on June 24, with final passage (85-12) on June 28. A Congressional Budget Office (CBO) estimate of the costs associated with S. 10 as ordered reported from the committee was released on June 23; see [http://www.cbo.gov/ftpdocs/64xx/doc6423/s10.pdf].

The comprehensive energy bills passed by the House and Senate are similar, but with important differences. A general summary follows of issues that have gained attention in the energy policy debate, with a summary of some of the major provisions in the House and Senate versions of H.R. 6. Background about the debate in the 108th Congress is included where helpful.

**Ethanol and MTBE.** Of the many issues left unresolved in attempts to pass a comprehensive energy bill in the 108th Congress, a primary stumbling block was the effort to promote ethanol as an automobile fuel, and the related problem involving the gasoline fuel additive MTBE. The provision, referred to as the “safe harbor” provision, would provide protection from product liability lawsuits for producers of MTBE and renewable fuels.

The roots of the controversy lie in the Clean Air Act Amendments of 1990, which mandated that “reformulated” gasoline required in some localities to improve air quality contain 2% oxygen. This requirement could be met by adding ethanol to gasoline, but it could also be achieved by adding a substance called methyl tertiary butyl ether (MTBE), which had been produced in small quantities for many years as an octane enhancer. Because MTBE was cheaper than ethanol and was easier to mix and transport, many refiners began using it to meet the new standards.

However, as its use spread, it became apparent that MTBE tended to escape easily from its fuel carriers and storage tanks, and contaminate water supplies, imparting a taste and odor that was unpalatable even in small quantities. This development led to moves to restrict and prohibit the use of MTBE. It also led a number of communities to sue refiners for the cost of decontaminating their water supplies. At the same time, evidence began to accumulate that oxygenating gasoline was not necessary to achieve the air quality benefits of reformulated gasoline. (For additional information, see CRS Report RS21676, *The Safe-Harbor Provision for Methyl Tertiary Butyl Ether (MTBE)*, by Aaron Flynn, and CRS Report RL32865, *Renewable Fuels and MTBE: A Comparison of Selected Legislative Initiatives*, by Brent D. Yacobucci, Mary E. Tiemann, and James E. McCarthy.)

The omnibus energy bills in the 108th Congress addressed this changing situation by repealing the oxygenation requirement in the Clean Air Act, but adding a new mandate that gasoline have an increasing amount of renewable fuel, presumably ethanol. Consumption of ethanol in gasoline in 2002 was 2.1 billion gallons. Under the renewable fuel standard in H.R. 6, the amount required to be consumed would be 3.1 billion gallons in 2005 and 5.0 billion gallons by 2012. This would still be a small proportion of the total amount of
gasoline consumed, which was close to 150 billion gallons in 2004, but was expected to stimulate the ethanol industry and the agricultural sector that supplies it. It was opposed by oil industry interests, who complained of the mandated increase in consumption of ethanol, which receives a substantial tax credit. Some suggested that it would raise prices locally, despite the subsidy.

The measure was in the original House version of H.R. 6 [108], and remained in the conference bill, where it was a major factor in the failure of the Senate cloture motion. It was dropped from S. 2095 in an attempt to get the bill through the Senate, but on the House side supporters of MTBE producers declared opposition to any bill that did not contain a safe harbor provision.

In the 109th Congress, H.R. 6, as reported by the House Committee on Energy and Commerce on April 13, 2005, retained the safe harbor provision, and also the ethanol mandate; an amendment to remove the safe harbor provision was defeated in committee. When H.R. 6 reached the floor of the House, opponents raised a point of order on the safe harbor provision. The motion was defeated by a six-vote margin. The Senate version of H.R. 6 does not contain the safe harbor provision. There have been reports of negotiations to achieve a compromise that would be acceptable to a majority of the Senate in the 109th Congress. There have also been reports that the “safe harbor” provision would be dropped from the energy bill and possibly attached to highway legislation (H.R. 3) currently in conference.

The Senate bill also would increase the renewable fuels/ethanol mandate from 5 billion gallons by 2012, in the House bill, to 8 billion gallons by 2012.

**Climate Change.** Unlike the Senate-passed bill, the House legislation does not contain provisions addressing climate change. The Senate bill would, among other provisions, establish a credit-based deployment program for technologies to reduce greenhouse gas intensity; support would include direct loans, loan guarantees, lines of credit, and production incentive payments. It would also establish grant and loan programs to deploy in developing countries technologies that have been developed or demonstrated in the United States. The Senate bill also includes language expressing that Congress should enact a program to control and reduce greenhouse gas emissions prior to the end of the First Session of the 109th Congress. The Senate rejected a proposal to establish mandatory caps on carbon dioxide emissions, as well as an amendment that the United States should reduce risks posed by climate change by participating in a negotiated binding international agreement.

(For additional information, see CRS Report RL32953, *Climate Change: Comparison and Analysis of S. 1151 and the Draft “Climate and Economy Insurance Act of 2005,”* by Brent Yacobucci and Larry Parker, and CRS Report RL32955, *Climate Change Legislation in the 109th Congress,* by Brent Yacobucci.)

**Arctic National Wildlife Refuge (ANWR) and Outer Continental Shelf (OCS).** Domestic oil production continues to fall. Some argue that the nation should be seizing the opportunity to develop the oil and natural gas resources that remain untapped. The potential Alaskan resources are high on this list, with estimates of technically recoverable resources there ranging from a 95% probability of 4.3 billion barrels to a 5%
probability of 11.8 billion barrels. However, some argue that drilling for oil in ANWR will have unacceptable environmental consequences on wildlife and vegetation, and that the land should be left undisturbed.

The legislation passed by the House during the 108th Congress would have opened up ANWR, but the Senate bill did not. Once it became apparent that there were insufficient votes in the Senate to pass an energy bill with ANWR provisions, the managers decided to leave ANWR out of the final conference bill.

The FY2006 budget transmitted to Congress by the Administration supports opening ANWR to exploration and development. The budget projects bonus bid revenues at $2.4 billion, half of which would accrue to the federal government and the balance to Alaska. On March 9, 2005, the Senate Budget Committee issued a budget resolution that assumes $2.5 billion of revenue over five years from leases in ANWR, and would allocate $2.0 billion in mandatory spending to comprehensive energy legislation and $4.5 billion for energy tax incentives. On March 16 the Senate rejected an amendment by Senator Cantwell to strike the ANWR provisions, by a vote of 49-51. The next day the Senate passed the budget resolution (S.Con.Res. 18).

The House version of the budget resolution (H.Con.Res. 95) passed on March 17 did not include the ANWR provisions; however, the final version of the resolution passed by both Houses on April 28, 2005, instructs the Senate Committee on Energy and Natural Resources and the House Committee on Resources to find $2.4 billion in savings through FY2010. Reconciliation legislation is not subject to Senate filibuster. Consequently, the comprehensive energy bill reported from the Senate Committee on Energy and Natural Resources does not include language authorizing exploration and development of ANWR as does the Energy Policy Act of 2005 (H.R. 6) passed by the House on April 21, 2005. There was no effort to add ANWR language to the Senate version of H.R. 6. An amendment to strip the language from the House bill during the House debate was defeated (200-231). (For additional information, see CRS Issue Brief IB10136, The Arctic National Wildlife Refuge: Controversies for the 109th Congress, by Lynne Corn.)

The Senate version of H.R. 6 would require an inventory of oil and natural gas resources on the Outer Continental Shelf (OCS). An amendment to strike this language from the bill was defeated on June 21 (44-52). The House-passed H.R. 6 also makes no changes to existing OCS leasing moratoria, but does not call for a resource study.

The Senate bill would also apportion $250 million annually during FY2007-FY2010 among states with production on the OCS. The funds would be required to be used for such purposes as protection of wetlands or mitigation of environmental impacts of offshore production. This language was introduced on the Senate floor during debate and was approved only after a vote (69-26) to waive Senate rules that would allow consideration of direct spending and revenue provisions that are projected to increase deficits.

**Electricity Restructuring.** Since the early 1990s, the electric utility industry has experienced a major transformation. Formerly the nationwide electricity system consisted of vertically integrated utilities with defined service areas, which they were responsible for supplying with power to meet demand. The rates they charged were set for the most part by state utility commissions, as were some other activities. Most power generating capacity was
owned by the utilities themselves, as were transmission lines and power distribution systems. Utility commissions determined rates based not only on the cost of power but also on the need to fund additional plants to meet future power demand.

Starting in the 1980s, a number of unregulated entities began producing power for sale to utilities at wholesale, and in 1992 the Energy Policy Act (EPACT, P.L. 102-486) removed some of the regulatory barriers to such unregulated electricity generation. At present many regulated utilities have sold their generating capacity and become essentially transmission and distribution entities, and an increasing share of generating capacity across the nation is owned and operated by companies not regulated as utilities. Many states have joined in Regional Transmission Organizations (RTOs) to distribute independently produced power to local utilities, but the details of these systems vary widely. The principle behind the restructuring has been that power produced by a competitive market of independent generators should be cheaper than that produced by a regulated monopoly.

Most state restructuring plans have not immediately met initial expectations, and many have faced serious problems. In California in particular, a combination of several factors, including demonstrated manipulation of the market by some independent power producers, resulted temporarily in power shortages and extremely high prices to some consumers. The California experience slowed down the process of restructuring in many other states, and also raised barriers to an effort in the Congress to produce a uniform national restructuring system. A massive power failure in much of the Northeast in 2003 added demands for improving the reliability of power transmission systems between regions. As a result of these various developments, the electricity provisions of major energy policy bills have been a source of major controversy. The main issue is not whether utility restructuring should take place; it is the federal role in guiding a restructuring process that is already taking place.

The major legislative issues in electricity restructuring are:

- enforceable standards for transmission system operation and reliability;
- repeal of Public Utility Holding Company Act (PUHCA), which utilities say they need in order to operate in the new competitive market, but which critics fear will threaten consumer interests;
- the role of the Federal Energy Regulatory Commission (FERC) in setting rules for marketing independent power production; and
- access to utility-owned transmission lines by independent producers.

Measures to improve the reliability of the transmission grid have gathered wide support, and all the major energy legislation contained reliability provisions. However, as the broad energy legislation foundered in the 108th Congress, a split developed between those who wanted to push a stand-alone reliability bill and those who insisted on keeping it in the comprehensive bill.

PUHCA was enacted in the 1930s to keep speculation in utility stocks and finances from affecting the utility’s ability to provide power to its service area. Utilities are under regulation from the Securities and Exchange Commission (SEC) and can invest in non-utility activities only if SEC finds that it will improve efficiency and service to utility customers. Advocates of PUHCA repeal argue that the statute is outdated and burdensome to utilities in the new competitive environment, and point to the abuses that led to the bankruptcy of...
Enron. The company had declared itself exempt from PUHCA regulation, and its self-declaration was not challenged until after the abuses were discovered, when an SEC administrative judge denied it. (For details, see [http://www.sec.gov/spotlight/enron.htm#enron_exempt].) Because these events occurred with PUHCA still on the books, repeal advocates contend that the statute is ineffective. But PUHCA repeal still has many opponents, who point out that utilities are still responsible for distributing power to customers, and their ability to do so could be adversely affected by unregulated and unsupervised activities and investments.

Until the restructuring and rise of unregulated power generators, FERC had the rather minor role in the power industry of regulating wholesale interstate transfers of power. Restructuring has thrust FERC into a much more important role of regulating the distribution of power from generators, some of them out of state, to utilities. FERC’s activities during and following the California crisis have been highly controversial. In addition, FERC has proposed a rulemaking on “standard market design” (SMD) to create wholesale power markets that would allow sellers to transact easily across transmission grid boundaries (FERC Notice of Proposed Rulemaking, Docket No. RM01-12-000, 18 C.F.R. Part 35, July 31, 2002). This proposal has also raised concerns in some states that have resisted or delayed restructuring.

These issues were dealt with differently in the various bills considered in the 108th Congress. All the major bills contained some reliability measures, but issues of consumer protection, of market design and the role of FERC, and numerous other questions remained unresolved. All the major bills in the last Congress repealed PUHCA, as does the version of H.R. 6 in the 109th Congress passed by the House. The Senate bill also includes PUHCA repeal language, but in markup a provision to give FERC additional merger review authority was added. The House-passed merger review provision would give FERC jurisdiction over transmission transactions. FERC merger review authority would also apply to natural gas utilities and generation-only transactions. In addition, the bill passed by the Senate requires FERC to determine that cross-subsidization would not result from a merger.

Most other electricity provisions in the House- and Senate-passed bills are essentially those contained in the electricity title as approved by the conference committee on H.R. 6 in the 108th Congress. Amendments to make major changes in this title of the bill were rejected during markup by the House Energy and Commerce Committee. One feature of that title, Sec. 1242 in the Committee Print, providing for “participant funding” of transmission projects, raised opposition from a number of interested parties as being inflexible and potentially inequitable, and was dropped in markup. (For additional information, see CRS Report RL32925, Electric Utility Provisions in House-Passed H.R. 6, 109th Congress, by Amy Abel, and CRS Report RL32728, Electric Utility Regulatory Reform: Issues for the 109th Congress, by Amy Abel.)

Fuel Economy. Gasoline and diesel fuel consumption account for roughly 50% of U.S. total petroleum consumption. Many argue that higher requirements for new vehicle fuel economy could go far in reducing automobile fuel consumption or holding consumption levels steady in future years. One of the first initiatives designed to have a significant effect on vehicle fuel demand was passage of corporate average fuel economy standards (CAFE) in the Energy Policy and Conservation Act of 1975 (EPCA, P.L. 94-163). Under the standards, the average fuel economy of all vehicles of a given class that a manufacturer sells
in a model year must be equal to, or greater than the standard. In the years since enactment, there have been periodic calls for stiffening or broadening the applicability of CAFE standards — especially as consumer demand has turned more to light-duty trucks and sport utility vehicles (SUVs), for which CAFE standards are set at a lower level than for passenger automobiles. The standard for passenger automobiles is 27.5 miles per gallon (mpg).

The 107th Congress lifted a prohibition on expenditure of appropriated funds by the National Highway Traffic Safety Administration (NHTSA) to undertake CAFE rulemakings. The lifting of the prohibition on NHTSA was a significant development, restoring the ability of NHTSA to perform analysis and rulemaking as it had until the rider was first imposed for FY1996. On April 1, 2003, NHTSA issued a final rule to boost the CAFE of light-duty trucks by 1.5 mpg by 2007. The rule sets the interim standards at 21.0 mpg for model year (MY) 2005, 21.6 mpg for MY 2006, and 22.2 for MY2007, and is the first increase in CAFE since MY1996.

A study by the National Commission on Energy Policy released in early December 2004 recommended that Congress instruct NHTSA to raise the standards to take advantage of current technologies that have been used to enable vehicles to have more size and power without reductions to baseline fuel economy.4

The Energy Policy Act of 2005 passed by the House on April 21, 2005, includes provisions strongly similar to language that appeared in the omnibus energy legislation reported from conference during the 108th Congress. The legislation would authorize $2 million annually during FY2006-FY2010 for the National Highway Traffic Safety Administration (NHTSA) to carry out fuel economy rulemakings. It also would expand the criteria that the agency takes into account in setting maximum feasible fuel economy for cars and light trucks. The new criteria require NHTSA to consider occupant safety and automotive industry employment in its determination of the maximum feasible fuel economy. The Senate bill would add more factors that NHTSA would need to consider in setting maximum feasible fuel economy standards. These would include the extent to which meeting higher CAFE standards might divert resources from developing advanced technologies.

All but one of the CAFE amendments offered during the House debate on H.R. 6 were defeated. The latter included an amendment to raise the CAFE standard for passenger automobiles to 33 miles over ten years (177-254). Another concern about the CAFE program has been that consumers have noted that in-use fuel economy rarely meets rated fuel economy, despite an adjustment that is made to the fuel economy ratings that appear on stickers posted to new cars. An amendment directing the Environmental Protection Agency (EPA) to weigh additional factors in this adjustment was approved (346-85).

TheSenate bill would provide NHTSA with $5 million annually to conduct CAFE activities for each fiscal year, FY2006-FY2010. The bill would require NHTSA to promulgate new car and light truck standards within a few years. An amendment to raise the

---

CAFE standards to 40 mpg for passenger cars by MY2016, and 27.5 for light-duty trucks, was rejected (28-67).

The Senate bill includes language to require the Administration to develop a plan to reduce U.S. oil consumption by 1 million barrels daily by 2015 from projected consumption levels. The amendment would not create any new authorities. Rather, it would give the Administration the latitude to use currently existing authorities, including CAFE. A similar provision was rejected as an amendment to the committee print marked up by the House Energy and Commerce Committee in mid-April 2005, and is not in the bill passed by the House. During debate on the Senate bill, an amendment that would have further required a 40% reduction in oil imports (7.6 mbd) by 2025 was rejected (47-53).

(For additional information, see CRS Issue Brief IB90122, Automobile and Light Truck Fuel Economy: The CAFE Standards, by Robert Bamberger.)

**Renewable Energy and Fuels.** Policymakers have debated for a number of years the role that renewable fuels might play in displacing U.S. oil consumption. Skeptics have argued that the production of some renewable fuels will consume more energy than will be produced. However, others argue that the nation needs to develop alternative fuels and that the economics and energy intensity of producing these fuels will become competitive once a market for renewables can be established.

As noted above (see “Ethanol and MTBE”), a major feature of the energy bills of the 108th Congress was a requirement that an increasing amount of gasoline contain renewable fuels such as ethanol. An amendment to H.R. 6 agreed to on the floor of the House would authorize $300 million annually during MY2006-MY2015 to encourage production of advanced diesel and hybrid vehicles and to provide consumer incentives for their purchase. The program would be subject to appropriated funds. Another amendment that was approved (239-190) would expand the types of renewable fuels under other provisions in H.R. 6 that would qualify for grants for the construction of production facilities. For a discussion of previously enacted tax cuts relating to renewables and alternative fuel, see the section on energy tax policy below.

For retail electricity suppliers, a Renewable Portfolio Standard (RPS) sets a minimum requirement (often a percentage) for electricity production from renewable energy resources or for the purchase of tradable credits that represent an equivalent amount of production. In the 109th Congress, two bills (H.R. 983 and S. 427) would establish an RPS. The Senate Committee on Energy and Natural Resources held a hearing on RPS on March 8, 2005. Regional differences in the availability of renewable resources, particularly resource availability in the southeastern United States, were a key issue at the hearing. In its markup of the energy legislation on April 12, 2005, the House Committee on Energy and Commerce rejected an amendment to add an RPS (1% in 2008, increasing by 1% annually through 2027)(17-30).

The Senate bill would mandate a federal RPS, which would require investor-owned utilities to generate at least 10% of their electricity from renewable energy sources, such as wind, solar, geothermal, or new hydroelectric facilities, by 2020. Proponents of an RPS note a growing number of states with an RPS and argued that an RPS could reduce electricity bills. Opponents raise concerns about the exclusion of existing hydropower facilities and

Energy Efficiency and Conservation. Over the years that energy policy has been debated, some have argued that improvements in the efficiency of energy use could reduce demand sufficiently to eliminate the pressure to discover new reserves of conventional fuels and to build more electric generation and transmission facilities. Energy efficiency is increased when an energy conversion device, such as a household appliance, automobile engine, or steam turbine, undergoes a technical change that enables it to provide the same service (lighting, heating, motor drive) while using less energy. The energy-saving result of the efficiency improvement is often called “energy conservation.” The energy efficiency of buildings can be improved through the use of certain materials such as attic insulation, components such as insulated windows, and design aspects such as solar orientation and shade tree landscaping. Further, the energy efficiency of communities and cities can be improved through architectural design, transportation system design, and land use planning. Thus, energy efficiency involves all aspects of energy production, distribution, and end-use.

Energy efficiency and conservation issues have continued to be part of the debate over comprehensive energy legislation in the 109th Congress. H.R. 6, as passed by the House on April 21, 2005, would reauthorize many programs, would set a new goal for reducing federal facilities’ energy use, would extend Energy Savings Performance Contracts (ESPC), would establish several standards for products and equipment, and could terminate cogeneration purchase requirements. Overall, many of the non-tax energy efficiency provisions in H.R. 6 are similar to the comprehensive bill considered in the 108th Congress. H.R. 6 also includes language that would provide a total of $8.1 billion in energy tax incentives, including $397 million in tax credits for energy efficiency. The bill would also provide an $18 million residential solar tax credit. However, critics of the bill argue that, to achieve the goal of reducing the cost of the measure, provisions favoring conventional fossil fuel production have been retained while many incentives to promote conservation and efficiency were dropped.

The Senate version of H.R. 6 includes stronger standards for products and equipment, and a major oil savings provision requiring development of a plan to reduce U.S. oil consumption by 1 million barrels daily by 2015 from projected consumption levels. Also, the tax package in the Senate bill has about $5.4 billion in tax incentives for energy efficiency, including $3.7 billion for equipment and $1.7 billion for vehicles. (For more information, see CRS Report RL32860, Energy Efficiency and Renewable Energy Legislation in the 109th Congress, and CRS Issue Brief IB10020, Budget, Oil Conservation, and Electricity Conservation Issues, by Fred Sissine).

Energy Tax Policy. Some argue that the historical volatility of energy prices has been a disincentive to make investments in new energy-related technologies and infrastructure that might boost production of conventional fuels and encourage homeowners, for example, to invest in systems that would reduce energy consumption for heating, cooling, and water heating. Tax policy has been one option to encourage both supply and demand-reduction efforts.
The energy tax provisions of H.R. 6 (109th Congress) as passed by the House include an $8.1 billion, 11-year tax reduction of energy taxes, weighed almost entirely toward fossil fuels and electricity. The Senate version of H.R. 6 includes a $14.1 billion, 11-year tax title aimed less toward fossil fuel production and more toward energy conservation and alternative fuels than the House measure.5 (For more information, see CRS Issue Brief IB10054, Energy Tax Policy, by Salvatore Lazzari.) Joint Committee on Taxation estimates of the revenue effects of the tax provisions of the Senate bill were released on June 23; see [http://www.house.gov/jct/x-47-05.pdf].

**The President's Hydrogen Fuel Initiative.** Demand for hybrid vehicles that can operate on both gasoline and electric power has been strong. More hybrid models are scheduled to be introduced in the coming years. However, some see the hybrid vehicle as a “bridging” technology until research and development produces an economically practical fleet of hydrogen vehicles, and an infrastructure for fueling them.

In January 2003 President Bush announced a new research and development initiative for hydrogen as a transportation fuel. A goal of the Hydrogen Fuel Initiative, and previously established FreedomCAR initiative, is to produce hydrogen-fueled engine systems by 2015 that achieve double to triple the efficiency of today’s conventional engines at a cost competitive with conventional engines.

Over five years, the Administration is seeking a total funding increase of $720 million. These initiatives would fund research on hydrogen fuel and fuel cells for transportation and stationary applications. The 108th Congress for FY2004 appropriated approximately $50 million for the initiatives ($20 million less than the Administration request) above the FY2003 level, and for FY2005 an additional $25 million above the FY2004 level. The Energy Policy Act of 2005 (H.R. 6) would authorize $4 billion during the period FY2006-FY2010. The comprehensive legislation in the 108th Congress would have set goals for the production of hydrogen-fueled passenger vehicles; no goals are included in the House version of H.R. 6. The Senate bill also includes a number of programs and provisions to further hydrogen fuel research.

Critics of the Administration initiative suggested that the hydrogen program was intended to forestall attempts to significantly raise vehicle CAFE standards, and that it relieves the automotive industry of assuming more initiative in pursuing technological innovations. In addition, they argue that hydrogen-fueled vehicles may ultimately be infeasible, and that attention and funding should be focused on other research areas. On the other hand, supporters argue that it is appropriate for government to become involved in the development of technologies that are too financially risky to draw private sector investment. At issue for these policymakers will be whether the federal initiative and level of funding is aggressive enough. (For additional information, see CRS Report RS21442, Hydrogen and Fuel Cell R&D: FreedomCAR and the President’s Hydrogen Fuel Initiative.)

---

**Nuclear Energy.** Reauthorization of the Price-Anderson Act nuclear liability system has been one of the top nuclear items on the energy agenda. Under Price-Anderson, commercial reactor accident damages would be paid through a combination of private-sector insurance and a nuclear industry self-insurance system. Liability is capped at the maximum coverage available under the system, currently about $10.9 billion. Price-Anderson also authorizes the Department of Energy (DOE) to indemnify its nuclear contractors. Authorization of the system for new commercial reactors ran out at the end of 2003, but it continues in place for existing reactors. Congress in the FY2005 Defense Authorization Act (P.L. 108-375) reauthorized the act for DOE contractors through 2006. H.R. 6 as passed by the House would extend the authorization of Price-Anderson for both commercial plants and DOE contractors through 2025, as does the Senate version of H.R. 6.

Several provisions dealing with security at nuclear power plants were also included in the House-passed bill. One measure would authorize Nuclear Regulatory Commission licensees, including guards at nuclear plants, to carry weapons, preempting some state restrictions. Another would require fingerprinting of nuclear plant workers for criminal background checks.

Another provision authorizes $1.3 billion for the design and construction of nuclear-hydrogen cogeneration projects at the Idaho National Laboratory and at existing reactors. The purpose would be to explore production of hydrogen fuel from nuclear energy. Currently, natural gas is the main source for hydrogen fuel. The bill approved by the Senate Energy and Natural Resources Committee includes a similar authorization. The Senate version of H.R. 6 would also make advanced nuclear power plants eligible for federal loan guarantees, and provide a tax credit for nuclear power production. (For more information, see CRS Issue Brief IB88090, Nuclear Energy Policy.)

**LEGISLATION**

**H.R. 6 (Barton)**

Energy Policy Act of 2005. Introduced April 18, 2005. Among other provisions, the bill would open up the Arctic National Wildlife Refuge (ANWR) to exploration and development, includes a “safe harbor” provision to protect methyl tertiary-butyl ether (MTBE) refiners from product liability suits, would establish a “refinery revitalization” program, and would permit the Federal Energy Regulatory Commission (FERC) to decide on the siting of liquefied natural gas (LNG) terminals. Passed by the House on April 21, 2005 (249-183). Passed by the Senate on June 28, 2005 (85-12).

**H.R. 610 (Biggert)**

A bill to provide for federal energy research, development, demonstration, and commercial application activities, and for other purposes. Would authorize roughly $44.1 billion over five years for research of deep sea drilling, clean coal technology, nuclear energy, fusion technology, and high-performance computers. Would authorize funding to improve energy efficiency of vehicles and buildings. Introduced February 8, 2005, and referred to several House committees. Reported favorably by voice vote from the Committee on Science, February 10, 2005.
H.R. 705 (Gilchrist)
Automobile Fuel Economy Act of 2005. To amend Title 49, United States Code, to require phased increases in the fuel efficiency standards applicable to light trucks; to require fuel economy standards for automobiles of up to 10,000 pounds gross vehicle weight; to increase the fuel economy of the federal fleet of vehicles, and for other purposes. Introduced February 9, 2005, and referred to House Subcommittee on Energy and Air Quality.

H.R. 1103 (Johnson)

H.R. 1541 (Thomas)
Enhanced Energy Infrastructure and Technology Tax Act. To amend the Internal Revenue Code of 1986 to enhance energy infrastructure properties in the United States and to encourage the use of certain energy technologies, and for other purposes. Introduced April 12, 2005. Ordered to be reported (26-11), April 13, 2005.

S. 10 (Domenici)

H.R. 6 (Tauzin) [108th Congress]
